

# MySQL Security: Best Practices

ORACLE®

89%

of Organizations Experienced Data Breaches, According to New Ponemon Report

Source: [Sixth Annual Benchmark Study on Privacy & Security of Healthcare Data](#), conducted by Ponemon Institute

66%

of the largest businesses in the UK have suffered a cyberattack or data breach within the past twelve months

Source: [UK government's Cyber Security Breaches Survey 2016](#)

25%

experience a repeated breach at least one a month

Source: [UK government's Cyber Security Breaches Survey 2016](#)

# Mega Breaches

429 Million identities exposed in 2015.

75%

Web sites with vulnerabilities.  
15% of all websites had a critical vulnerability.

9

In 2015, a record of nine mega-breaches were reported.

One world's largest 191M.

(Mega-breach = more than 10 million records.)

Mobile Vulnerabilities on the rise – up 214%

Infection by SQL Injection still strong.

Malware attacks on databases

Source: Internet Security Threat Report 2016, Symantec

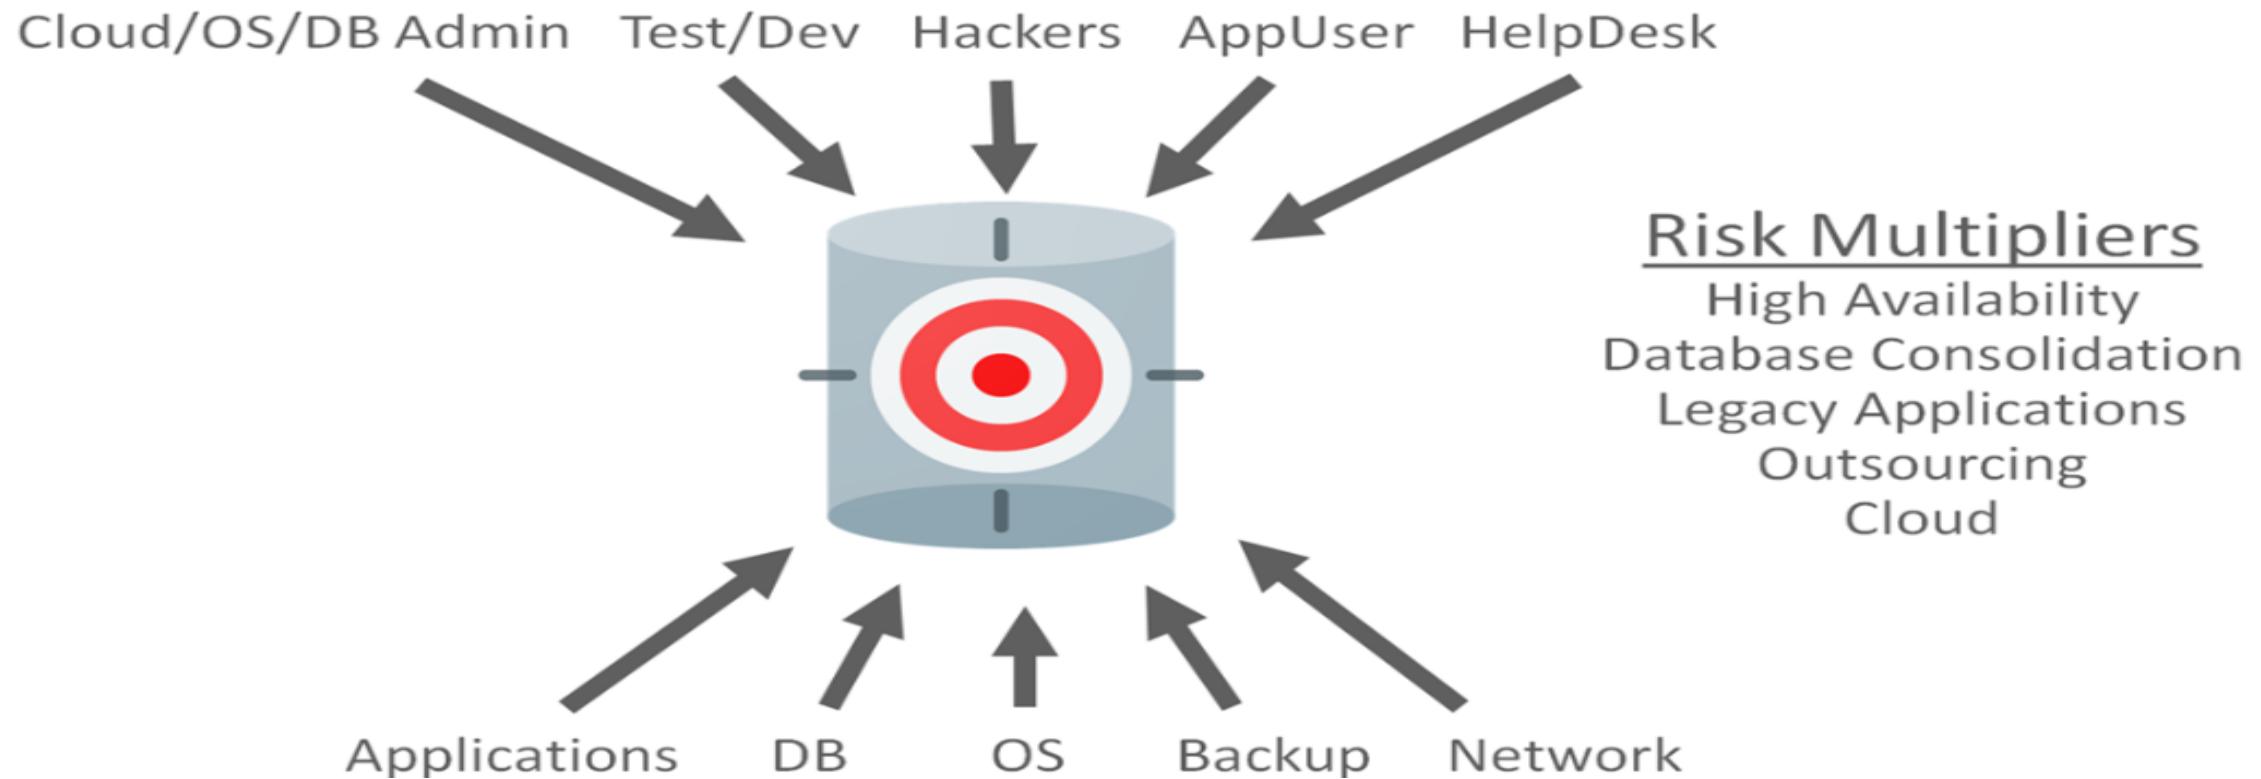

# Database Vulnerabilities

- Poor Configurations
  - Set controls and change default setting
- Over Privileged Accounts
  - Privilege Policies
- Weak Access Control
  - Dedicated Administrative Accounts
- Weak Authentication
  - Strong Password Enforcement
- Weak Auditing
  - Compliance & Audit Policies
- Lack of Encryption
  - Data, Backup, & Network Encryption
- Proper Credential & Key Management
  - Use mysql\_config\_editor , Key Vaults
- Unsecured Backups
  - Encrypted Backups
- No Monitoring
  - Security Monitoring, Users, Objects
- Poorly Coded Applications
  - Database Firewall

# Database Attacks

- SQL Injection
  - Prevention: DB Firewall, White List, Input Validation
- Buffer Overflow
  - Prevention: Frequently apply Database Software updates, DB Firewall, White List, Input Validation
- Brute Force Attack
  - Prevention: lock out accounts after a defined number of incorrect attempts.
- Network Eavesdropping
  - Prevention: Require SSL/TLS for all Connections and Transport
- Malware
  - Prevention: Tight Access Controls, Limited Network IP access, Change default settings, Encryption

# Attack Vectors and Targets for Databases

# Database Malicious Actions

- Information Disclosure: Obtain credit card and other personal information
  - Defense: Encryption – Data and Network, Tighter Access Controls
- Denial of Service: Run resource intensive queries
  - Defense: Resource Usage Limits – Set various limits – Max Connections, Sessions, Timeouts, ...
- Elevation of Privilege: Retrieve and use administrator credentials
  - Defense: Stronger authentication, Access Controls, Auditing
- Spoofing: Retrieve and use other credentials
  - Defense: Stronger account and password policies
- Tampering: Change data in the database, Delete transaction records
  - Defense: Tighter Access Controls, Auditing, Monitoring, Backups

## **Disclaimer**

The information in this document may not be construed or used as legal advice about the content, interpretation or application of any law, regulation or regulatory guideline. Customers and prospective customers must seek their own legal counsel to understand the applicability of any law or regulation on their processing of personal data, including through the use of any vendor's products or services.

# Regulatory Compliance

- Regulations
  - PCI – DSS: Payment Card Data
  - HIPAA: Privacy of Health Data
  - Sarbanes Oxley, GLBA, The USA Patriot Act:  
Financial Data, NPI "personally identifiable financial information"
  - FERPA – Student Data
  - EU General Data Protection Directive: Protection of Personal Data (GDPR)
  - Data Protection Act (UK): Protection of Personal Data
- Requirements
  - Continuous Monitoring (Users, Schema, Backups, etc)
  - Data Protection (Encryption, Privilege Management, etc.)
  - Data Retention (Backups, User Activity, etc.)
  - Data Auditing (User activity, etc.)

Data Protection Act 1998

# PCI-DSS

- Requirement 2: Secure Configurations, Security Settings & Patching
  - Not Using Vendor Default Passwords and Security Settings
- Requirement 3: Protecting Cardholder Data – Strong Cryptography
  - Protect Stored Cardholder Data
  - Protect Encryption Keys
- Requirement 6: Up to Date Patching and Secure Systems
  - Develop and Maintain Secure Systems and Applications
- Requirement 7: User Access and Authorization
  - Restrict Access to Cardholder Data by Need to Know
- Requirement 8: Identity and Access Management
  - Identify and Authenticate Access to System Components
- Requirement 10: Monitoring, Tracking and Auditing
  - Track and Monitor Access to Cardholder Data

White Paper

*A Guide to MySQL  
and PCI Compliance*

# HIPAA / HITECH

- Access Controls
  - Access only to those persons or software programs that have been granted access rights
  - Unique User Identification, Emergency Access Procedure, Automatic Logoff, Encryption and Decryption
- Authentication
  - Verify that a person or entity seeking electronic health information is the one claimed
- Integrity
  - Protect electronic protected health information from improper alteration or destruction
- Transmission Security
  - Guard against unauthorized access that is being transmitted over a network
- Encryption
  - Encrypt electronic protected health information. Separation of encryption keys from the data they protect.
- Audit Control
  - Record and examine activity that contain or use electronic protected health information

# Sarbanes Oxley

- Accurate and factual business and financial reports
  - Verify that the records protected from tampering and modification
- Protect data accuracy and integrity
  - Minimal permissions on data for each employee
  - Deny any privileges above minimal
  - Audit all activity

# EU General Data Protection Regulation (GDPR)

- Data privacy as a fundamental right
- Data protection responsibilities, baselines, principles
- Enforcement Powers
- Published May 2016, Enforceable by May 2018
- Fines up to greater of 4% of Global revenue or 20M Euros.

## Focus on

- Assessment – Processes, Profiles, Data Sensitivity, Risks
- Prevention – Encryption, Anonymization, Access Controls, Separation of Duties
- Detect – Auditing, Activity monitoring, Alerting, Reporting

# MySQL Enterprise Features and GDPR

- Assess Risks (Articles 35, 90, 91)
  - MySQL Enterprise Monitor
  - MySQL Workbench Data Modeling tool
- Prevent Attacks (Articles 32, 83, 28, 26, 5, 20, 27, 30, 64)
  - MySQL Enterprise TDE Transparent Data Encryption)
  - MySQL Enterprise Firewall
- Detect (Articles 30, 82, 33)
  - MySQL Enterprise Audit
  - MySQL Enterprise Firewall

# Data Protection Act – UK 1998

Data Protection Act 1998

- Personal data shall be processed fairly and lawfully
- Personal data shall be obtained only for one or more specified and lawful purposes
- Personal data shall be adequate, relevant and not excessive
- Personal data shall be accurate and, where necessary, kept up to date
- Personal data processed for any purpose shall not be kept for longer than is necessary
- Personal data shall be processed in accordance with the rights of data subjects
- Measures shall be taken against unauthorized or unlawful processing of personal data and against accidental loss or destruction of, or damage to, personal data.
- Personal data shall not be transferred to a country or territory outside the European Economic Area

# DBA Responsibilities

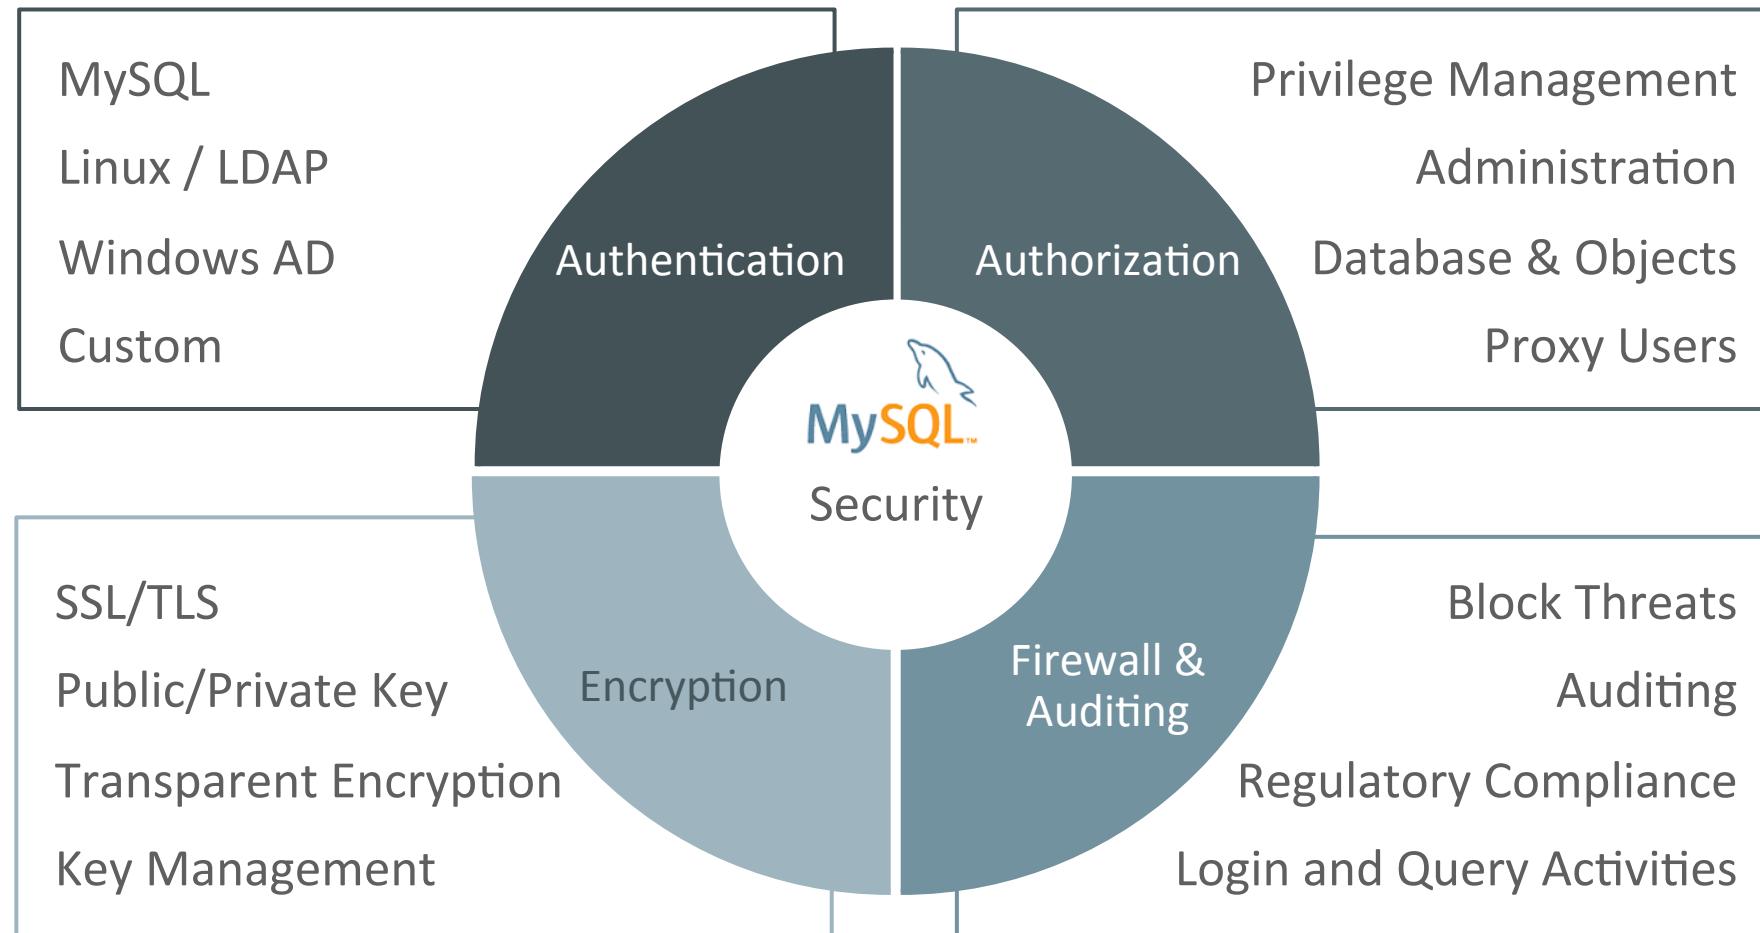

- Ensure only users who should get access, can get access
- Limit what users and applications can do
- Limit from where users and applications can access data
- Watch what is happening, and when it happened
- Make sure to back things up securely
- Minimize attack surface
- Ensure encryption keys are protected and managed

# MySQL Security Overview

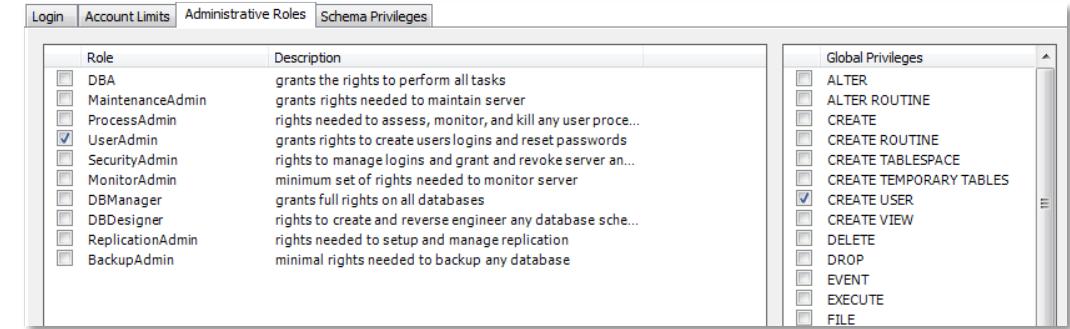

# MySQL Security Overview

# MySQL Authorization

- Administrative Privileges
- Database Privileges
- Session Limits and Object Privileges
- Fine grained controls over user privileges
  - Creating, altering and deleting databases
  - Creating, altering and deleting tables
  - Execute INSERT, SELECT, UPDATE, DELETE queries
  - Create, execute, or delete stored procedures and with what rights
  - Create or delete indexes

*Security Privilege Management in MySQL Workbench*

# MySQL Privilege Management

- user: user accounts, global privileges columns
- db: database-level privileges
- tables\_priv: Contains table-level privileges
- columns\_priv: Contains column-level privileges
- procs\_priv: Contains stored procedure and function privileges
- proxies\_priv: Contains proxy-user

The screenshot shows a MySQL privilege management interface. On the left, a table lists user accounts with their host information. On the right, tabs for 'Login', 'Account Limits', 'Administrative Roles', and 'Schema Privileges' are visible, with 'Account Limits' being the active tab. The 'Account Limits' section contains four fields: 'Max. Queries' (100), 'Max. Updates' (50), 'Max. Connections' (20), and 'Concurrent Connections' (10), each with a description below it.

User	From Host
(!) <anonymous>	%
mysqlbackup	localhost
newuser	%
newuser1	%
root	localhost
root	127.0.0.1
root	::1
webuser	localhost

Login		Account Limits	Administrative Roles	Schema Privileges
Max. Queries:	100	Number of queries the account can execute within one hour.		
Max. Updates:	50	Number of updates the account can execute within one hour.		
Max. Connections:	20	The number of times the account can connect to the server per hour.		
Concurrent Connections:	10	The number of simultaneous connections to the server the account can have.		

# MySQL Privilege Management Grant Tables

## user

- User Accounts
- Global Privileges

## db

- Database Level Privileges
- Database, Tables, Objects
- User and host

## tables\_priv

- Table level privileges
- Table and columns

## columns\_priv

- Specific columns

## procs\_priv

- Stored Procedures
- Functions
- Single function privilege

## proxies\_priv

- Proxy Users
- Proxy Privileges

# MySQL Privilege Management

- Continuous assessment
  - Configuration
  - Users
  - Permissions and Rights
- Audit & Review activity
  - Who – does activity match expectation
  - What – is this it limited as expected
  - When – acts often are at odd / off peak times
  - Where – Connections should be from expected hosts
- MySQL has simple to use controls and privileges to set secure limits

# MySQL Authentication

- Built in Authentication
  - `user` table stores users and encrypted passwords
- External Authentication with MySQL Enterprise Authentication
  - Microsoft Active Directory
  - Linux PAMs (Pluggable Authentication Modules)
    - Support LDAP and more
- X.509
  - Server authenticates client via certificates
- MySQL Native, SHA 256 Password plugin
  - Native uses SHA1 or plugin with SHA-256 hashing and per user salting for user account passwords.

# MySQL Password Policies

- Accounts without Passwords
  - Assign passwords to all accounts to prevent unauthorized use
- Password Validation Plugin
  - Enforce Strong Passwords
- Password Expiration/Rotation
  - Require users to reset their password
- Account lockout (in v. 5.7)
- Password Retry Rules (in v. 5.7.16+)

# MySQL Encryption

- SSL/TLS Encryption
  - Between MySQL clients and Server
  - Replication: Between Master & Slave
- Data Encryption
  - AES Encrypt/Decrypt
- MySQL Enterprise TDE
  - Transparent Data Encryption
  - Key Management (KMIP)
- MySQL Enterprise Encryption
  - Asymmetric Encrypt/Decrypt
  - Generate Public Key and Private Keys
  - Derive Session Keys
  - Digital Signatures
- MySQL Enterprise Backup
  - AES Encrypt/Decrypt

# SSL/TLS

- Encrypted connections
  - Between MySQL Client and Server
  - Replication: Between Master & Slave
- MySQL enables encryption on a per-connection basis
  - Identity verification using the X509 standard
- Specify the appropriate SSL certificate and key files
- Will work with trusted CAs (Certificate Authorities)
- Supports CRLs – Certificate Revocation Lists

# Database Firewall

- SQL Injection Attacks
  - #1 Web Application Vulnerability
  - 77% of Web Sites had vulnerabilities
- MySQL Enterprise Firewall
  - Monitor database statements in real-time
  - Automatic White List “rules” generation for any application
  - Block SQL Injection Attacks
  - Intrusion Detection System

# Database Auditing

- Auditing for Security & Compliance
  - FIPS, HIPAA, PCI-DSS, SOX, DISA STIG, ...
- MySQL built-in logging infrastructure:
  - general log, error log
- MySQL Enterprise Audit
  - Granularity made for auditing
  - Can be modified live
  - Contains additional details
  - Compatible with Oracle Audit Vault.

# MySQL Database Hardening

## Installation

- Mysql\_secure\_installation
- Keep MySQL up to date
  - MySQL Installer for Windows
  - Yum/Apt Repository

## Configuration

- Firewall
- Auditing and Logging
- Limit Network Access
- Monitor changes

## User Management

- Remove Extra Accounts
- Grant Minimal Privileges
- Audit users and privileges

## Passwords

- Strong Password Policy
- Hashing, Expiration
- Password Validation Plugin

## Encryption

- SSL/TLS for Secure Connections
- Data Encryption (AES, RSA)
- TDE

## Backups

- Monitor Backups
- Encrypt Backups

# MySQL 5.7 Linux Packages - Security Improvements

- Test/Demo database has been removed
  - Now in separate packages
- Anonymous account creation is removed.
- Creation of single root account – local host only
- Default installation ensures encrypted communication by default
  - Automatic generation of SSL/RSA Certs/Keys
    - For EE : At server startup if options Certs/Keys were not set
    - For CE : Through new mysql\_ssl\_rsa\_setup utility
- Automatic detection of SSL Certs/Keys
  - Client attempts secure TLS connection by default
  - Compile time restriction over location used for data import/export operations
  - Ensures location has restricted access
  - Only mysql user and group
  - Supports disabling data import/export
    - Set secure-file-priv to empty string

MySQL Installer for Windows includes various Security Setup and Hardening Steps

# MySQL Database Hardening: Installation

- MySQL\_Secure\_Installation / MySQL Installer for Windows
  - Set a **strong** password for root account
  - Remove root accounts that are accessible from outside the local host
  - Remove anonymous-user accounts
  - Remove the test database
    - Which by default can be accessed by all users
    - Including Anonymous Users
- Keep MySQL up to date
  - Repos – YUM/APT/SUSE
  - MySQL Installer for Windows

# Software Updates - Database and OS Maintenance

- Maintaining security requires keeping Operating System and MySQL security patches up to date.
  - May require a restart (mysql or operating system) to take effect.
- To enable seamless upgrades consider MySQL Replication
  - Allows for changes to be performed in a rolling fashion
    - Best practice to upgrade slaves first
  - MySQL 5.6 and above supports GTID-based replication
    - Provides for simple rolling upgrades
- Follow OS vendor specific hardening Guidelines
  - For example
    - <http://www.oracle.com/technetwork/articles/servers-storage-admin/tips-harden-oracle-linux-1695888.html>

# MySQL Database Hardening: Configuration

- Audit Activity
  - *Use Enterprise Audit*
  - *Alt. Transiently enable Query Logging*
  - Monitor and Inspect regularly
- Disable or Limit Remote Access
  - If local “skip-networking” or bind-address=127.0.0.1
  - If Remote access then limit hosts/IP
- Consider changing default port
- Change root username
- Disable unauthorized reading from local files
  - Disable LOAD DATA LOCAL INFILE
- Run MySQL on non default port
  - More difficult to find database
- Limit MySQL OS User
- Ensure secure-auth is enabled
- Configure External Key Management

# MySQL Database Hardening: Best Practices

Parameter	Recommended Value	Why
Secure_file_priv	A Designated Leaf directory for data loads	Only allows file to be loaded from a specific location. Limits use of MySQL to get data from across the OS
Symbolic_links	Boolean – NO	Prevents redirection into less secure filesystem directories
Default-storage_engine	InnoDB	Ensures transactions commits, ???
General-log	Boolean – OFF	Should only be used for debugging – off otherwise
Log-raw	Default - OFF	Should only be used for debugging – off otherwise
Skip-networking or bind-address	ON 127.0.0.1	If all local, then block network connections or limit to the local host.
SSL options	Set valid values	Should encrypt network communication

# MySQL Database Hardening: Password Policies

- Enforce Strong Password Policies
- Password Hashing
- Password Expiration
- Password Validation Plugin
- Authentication Plugin
  - Inherits the password policies from the component
  - LDAP, Windows Active Directory, etc.
- Disable accounts when not in use
  - Account lockout (5.7+)

# MySQL Database Hardening: Encryption

- Encrypted Communication and More
- SSL/TLS encrypted for transport
- X.509 adds additional “Factor” – something you have – in addition to username/password or other authentication
  - Assures the client is validated – thus more likely trusted
- Use database and application level encryption of highly sensitive data
- Use database or application functions to mask or de-identify data
- Consider Public Keys for Applications that encrypt only
- Use Transparent Data Encryption with external Key Management Services

# MySQL Database Hardening: Backups

- Backups are Business Critical
  - Used to restore after attack
  - Migrate, move or clone server
  - Part of Audit Trail
- Regularly Scheduled Backups
- Monitor Backups
- Encrypt Backups

# Applications and Credentials - Best Practices

- Applications – minimize sharing a credentials (username/password)
  - Finer grained the better – don't overload across many applications/servers
- Should enable support for credential rotation
  - Do not require all passwords to be changed in synchronization.
  - Facilitates better troubleshooting and root-cause analysis.
- Steps to changing credentials should be secure and straightforward
  - Not embedded in your code
    - Can be changed without redeploying an application
    - Should never be stored in version control and must differ between environments.
    - Applications should get credentials using a secure configuration methodology.

# MySQL Enterprise Edition

- MySQL Enterprise **Authentication**
  - External Authentication Modules
    - Microsoft AD, Linux PAMs
- MySQL Enterprise **Encryption**
  - Public/Private Key Cryptography
  - Asymmetric Encryption
  - Digital Signatures, Data Validation
- MySQL Enterprise **Firewall**
  - Block SQL Injection Attacks
  - Intrusion Detection
- MySQL Enterprise **Audit**
  - User Activity Auditing, Regulatory Compliance
- MySQL Enterprise **Monitor**
  - Changes in Database Configurations, Users Permissions, Database Schema, Passwords
- MySQL Enterprise **Backup**
  - Securing Backups, AES 256 encryption
- MySQL Enterprise **TDE**
  - AES 256 encryption
  - Key Management

# MySQL Enterprise Monitor

- Enforce MySQL Security Best Practices
  - Identifies Vulnerabilities
  - Assesses current setup against security hardening policies
- Monitoring & Alerting
  - User Monitoring
  - Password Monitoring
  - Schema Change Monitoring
  - Backup Monitoring
  - Configuration Management
  - Configuration Tuning Advice
- Centralized User Management

**Problem Description**  
When users create weak passwords (e.g. 'password' or 'abcd') it compromises the security of the server, making it easier for unauthorized people to guess the password and gain access to the server. Starting with MySQL Server 5.6, MySQL offers the 'validate\_password' plugin that can be used to test passwords and improve security. With this plugin you can implement and enforce a policy for password strength (e.g. passwords must be at least 8 characters long, have both lowercase and uppercase letters, and contain at least one special nonalphanumeric character).

**Expression**  
`%status% == "ACTIVE" && %validate_password_policy% == THRESHOLD`

*"I definitely recommend the MySQL Enterprise Monitor to DBAs who don't have a ton of MySQL experience. It makes monitoring MySQL security, performance and availability very easy to understand and to act on."*

Sandi Barr  
Sr. Software Engineer  
Schneider Electric

# Oracle Enterprise Manager for MySQL

- Availability monitoring
- Performance monitoring
- Configuration monitoring
- All available metrics collected
  - Allowing for custom threshold based incident reports
- MySQL auto-detection

**ORACLE®**  
ENTERPRISE MANAGER

# MySQL Enterprise Firewall

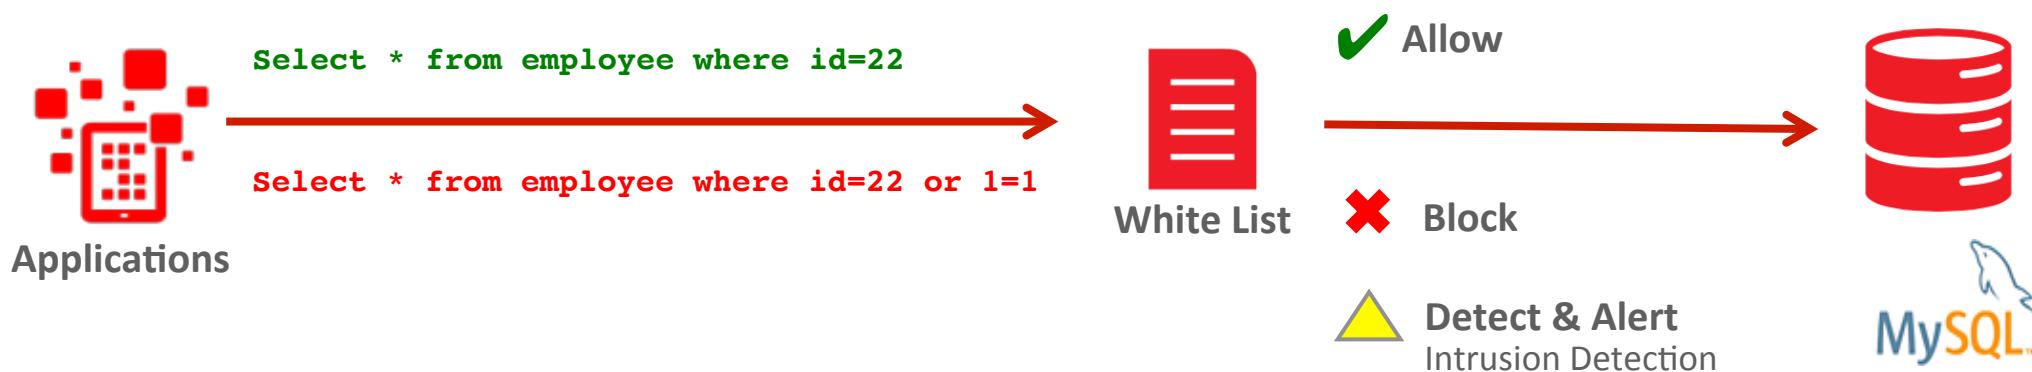

- Real Time Protection
  - Queries analyzed and matched against White List
- Blocks SQL Injection Attacks
  - Block Out of Policy Transactions
- Intrusion Detection
  - Detect and Alert on Out of Policy Transactions
- Learns White List
  - Automated creation of approved list of SQL command patterns on a per user basis
- Transparent
  - No changes to application required

Enterprise Firewall		Configured: 8 of 8
<input type="checkbox"/> Item	Info	
<input type="checkbox"/>   Account Has Overly Permissive White List		
<input type="checkbox"/>   Account Sending Excessive Percentage of Blocked Queries		
<input type="checkbox"/>   Account Without Firewall Protection		
<input type="checkbox"/>   Excessive Number of Queries Blocked By Firewall		
<input type="checkbox"/>   Firewall Max Query Size Too Small		
<input type="checkbox"/>   Firewall Not Enabled		
<input type="checkbox"/>   Firewall Not Installed		
<input type="checkbox"/>   Firewall Trace Has Been Enabled		

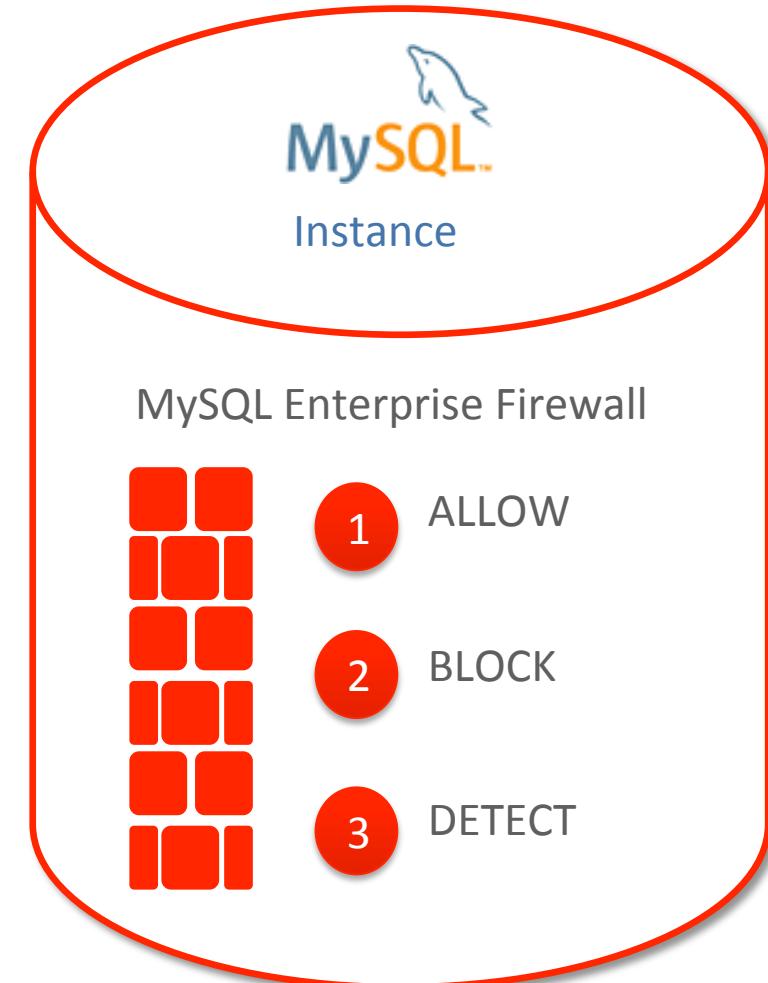

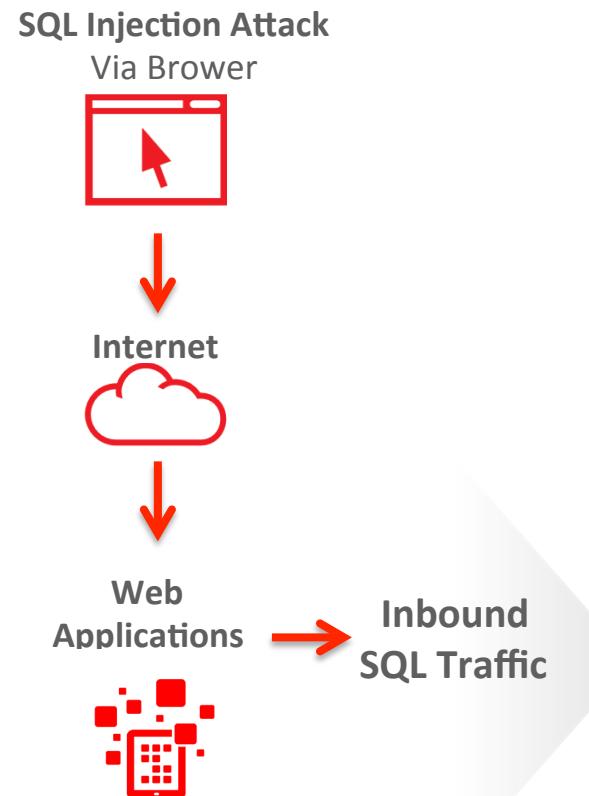

*MySQL Enterprise Firewall monitoring*

# MySQL Enterprise Firewall

- Block SQL Injection Attacks
  - Allow: SQL Statements that match Whitelist
  - Block: SQL statements that are not on Whitelist
- Intrusion Detection System
  - Detect: SQL statements that are not on Whitelist
    - SQL Statements execute and alert administrators

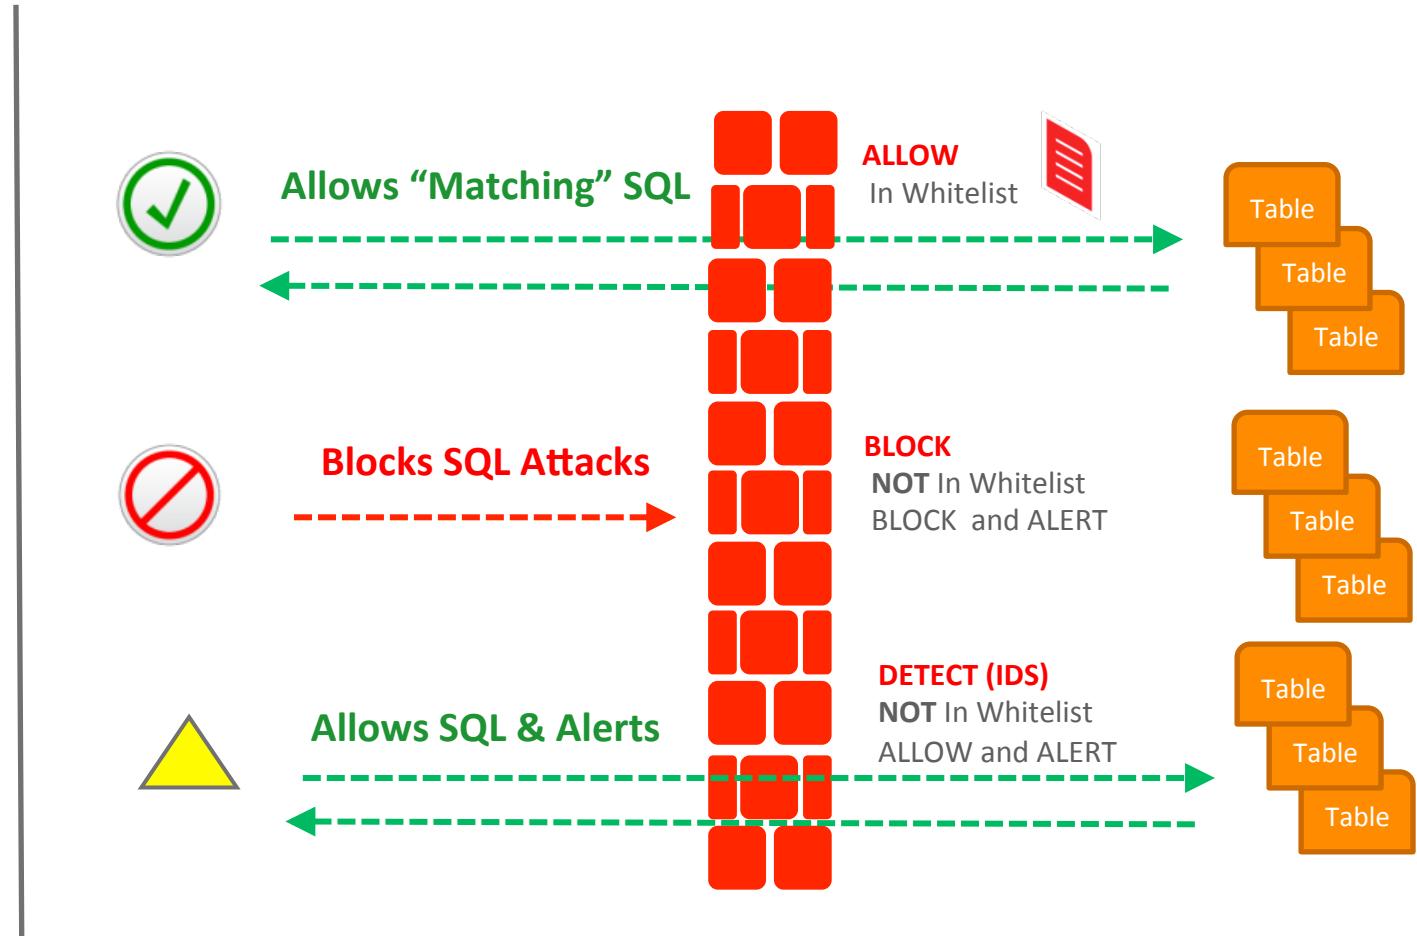

# MySQL Enterprise Firewall: Overview

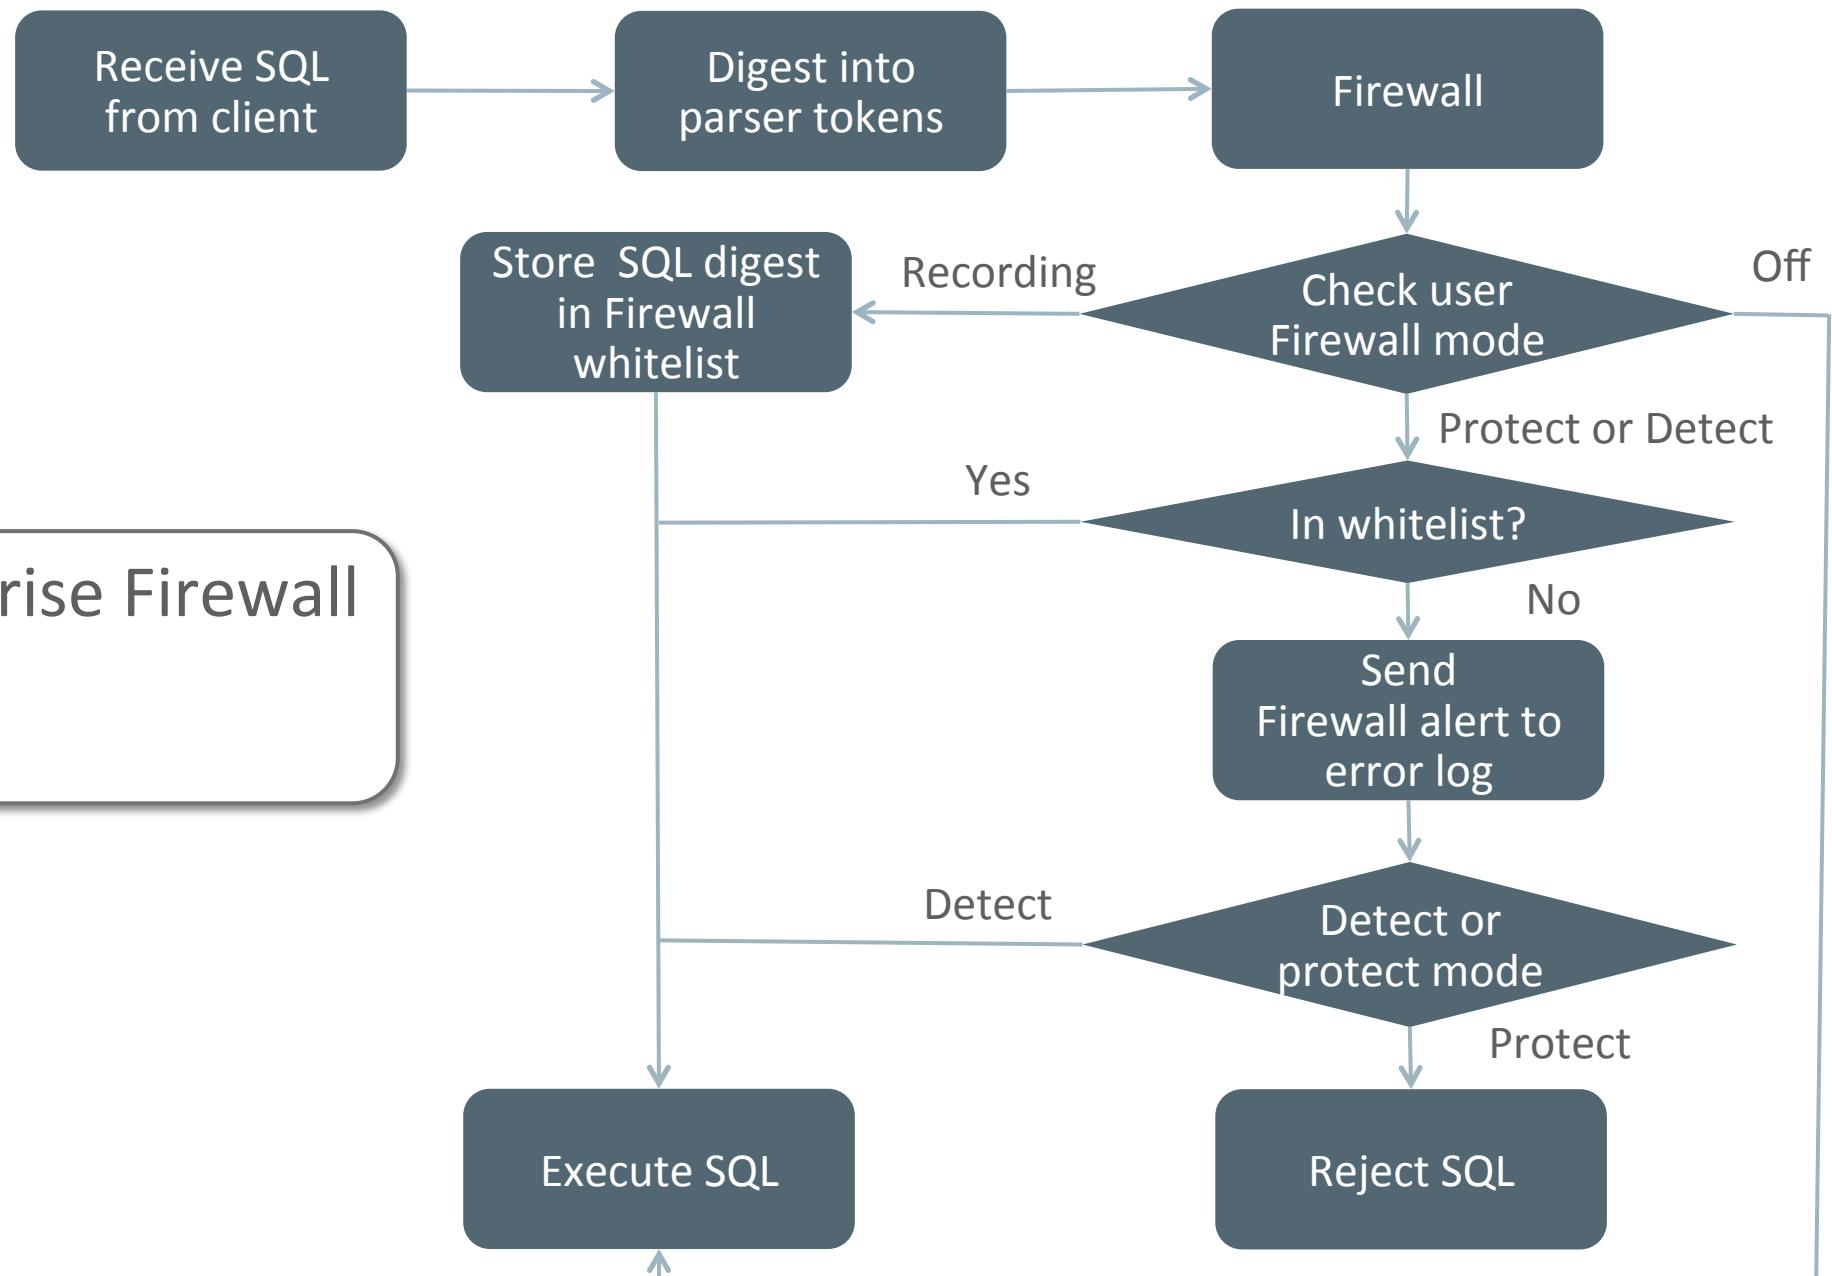

# MySQL Enterprise Firewall: Operating Modes

- 1 ALLOW – Execute SQL  
- SQL Matches Whitelist
  
- 2 BLOCK – Block the request  
- Not in Whitelist
  
- 3 DETECT – Execute SQL & Alert  
- Not in Whitelist

## MySQL Enterprise Firewall Workflow

# MySQL Enterprise Firewall Details

- Firewall operation is turned on at a per user level
- Per User States are

—RECORDING	<code>call mysql.set_firewall_mode ('fwuser@localhost', 'RECORDING');</code>
—PROTECTING	<code>call mysql.set_firewall_mode ('fwuser@localhost', 'PROTECTING');</code>
—DETECTING	<code>call mysql.set_firewall_mode ('fwuser@localhost', 'DETECTING');</code>
—OFF	<code>call mysql.set_firewall_mode ('fwuser@localhost', 'OFF');</code>

# MySQL Enterprise Firewall:

## What happens when SQL is blocked in Protect Mode?

- The client application gets an ERROR

```
mysql> SELECT first_name, last_name FROM customer WHERE customer_id = 1 OR TRUE;
```

```
ERROR 1045 (28000): Statement was blocked by Firewall
```

```
mysql> SHOW DATABASES;
```

```
ERROR 1045 (28000): Statement was blocked by Firewall
```

```
mysql> TRUNCATE TABLE mysql.user;
```

```
ERROR 1045 (28000): Statement was blocked by Firewall
```

- Reported to the Error Log
- Increment Counter

# MySQL Enterprise Firewall: Monitoring

## Firewall Status Counters

```
mysql> SHOW GLOBAL STATUS LIKE 'Firewall%';
+-----+-----+
| Variable_name          | Value |
+-----+-----+
| Firewall_access_denied | 3      |
| Firewall_access_granted | 2      |
| Firewall_access_suspicious | 1      |
| Firewall_cached_entries | 4      |
+-----+-----+
```

# MySQL Enterprise Firewall: Whitelist Example

```
• mysql> SELECT userhost, substr(rule,1,80) FROM mysql.firewall_whitelist WHERE userhost= 'wpuser@localhost';

# MySQL Enterprise **Authentication**

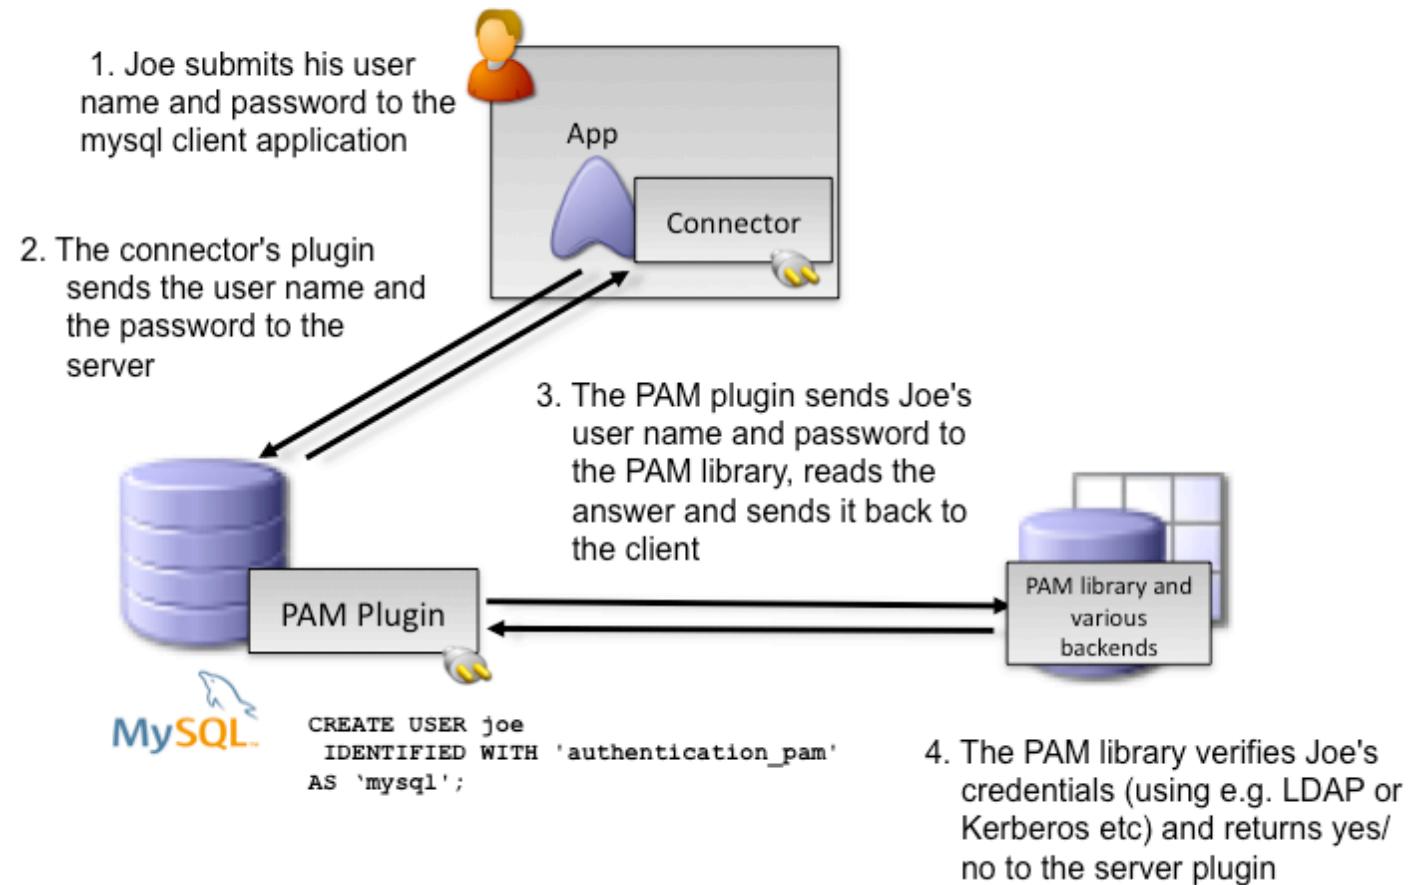

Integrates MySQL with existing security infrastructures

- Integrate with Centralized Authentication Infrastructure
  - Centralized Account Management
  - Password Policy Management
  - Groups & Roles
- PAM (Pluggable Authentication Modules)
  - Standard interface (Unix, LDAP, Kerberos, others)
  - Windows
    - Access native Windows service - Use to Authenticate users using Windows Active Directory or to a native host

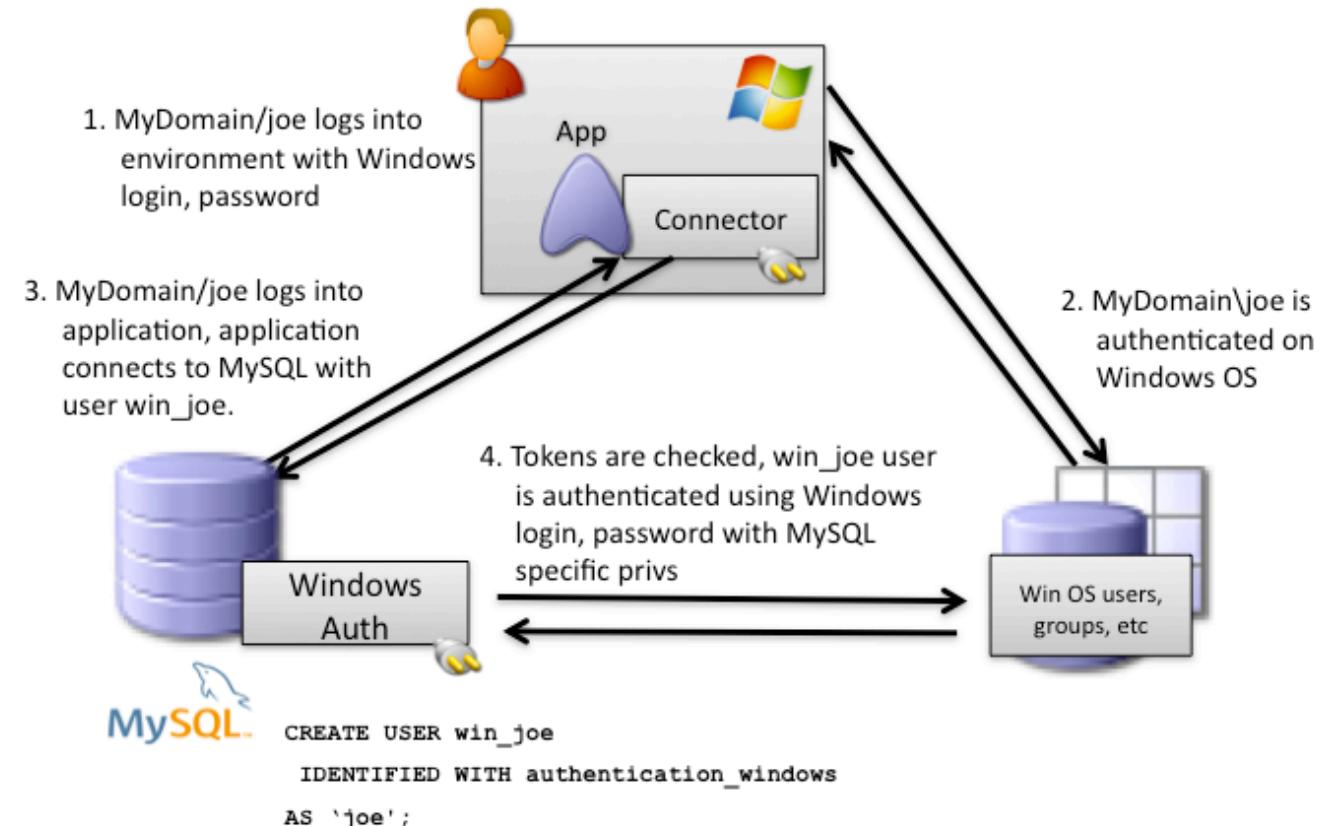

# MySQL Enterprise Authentication: PAM

- Standard Interface
  - LDAP
  - Unix/Linux
- Proxy Users

# MySQL Enterprise Authentication: Windows

- Windows Active Directory
- Windows Native Services

# MySQL Enterprise Authentication: **LDAP, Others?**

- Roadmap includes native LDAP
  - Two modes
    - User/Password
    - Token Based
- Other integrations for authentication that are wanted?

# MySQL Enterprise **Encryption**

- MySQL encryption functions
  - Symmetric encryption AES256 (All Editions)
  - Public-key / asymmetric cryptography – RSA
- Key management functions
  - Generate public and private keys
  - Key exchange methods: DH
- Sign and verify data functions
  - Cryptographic hashing for digital signing, verification, & validation – RSA,DSA

# MySQL Enterprise Encryption

Encryption/Decryption within MySQL

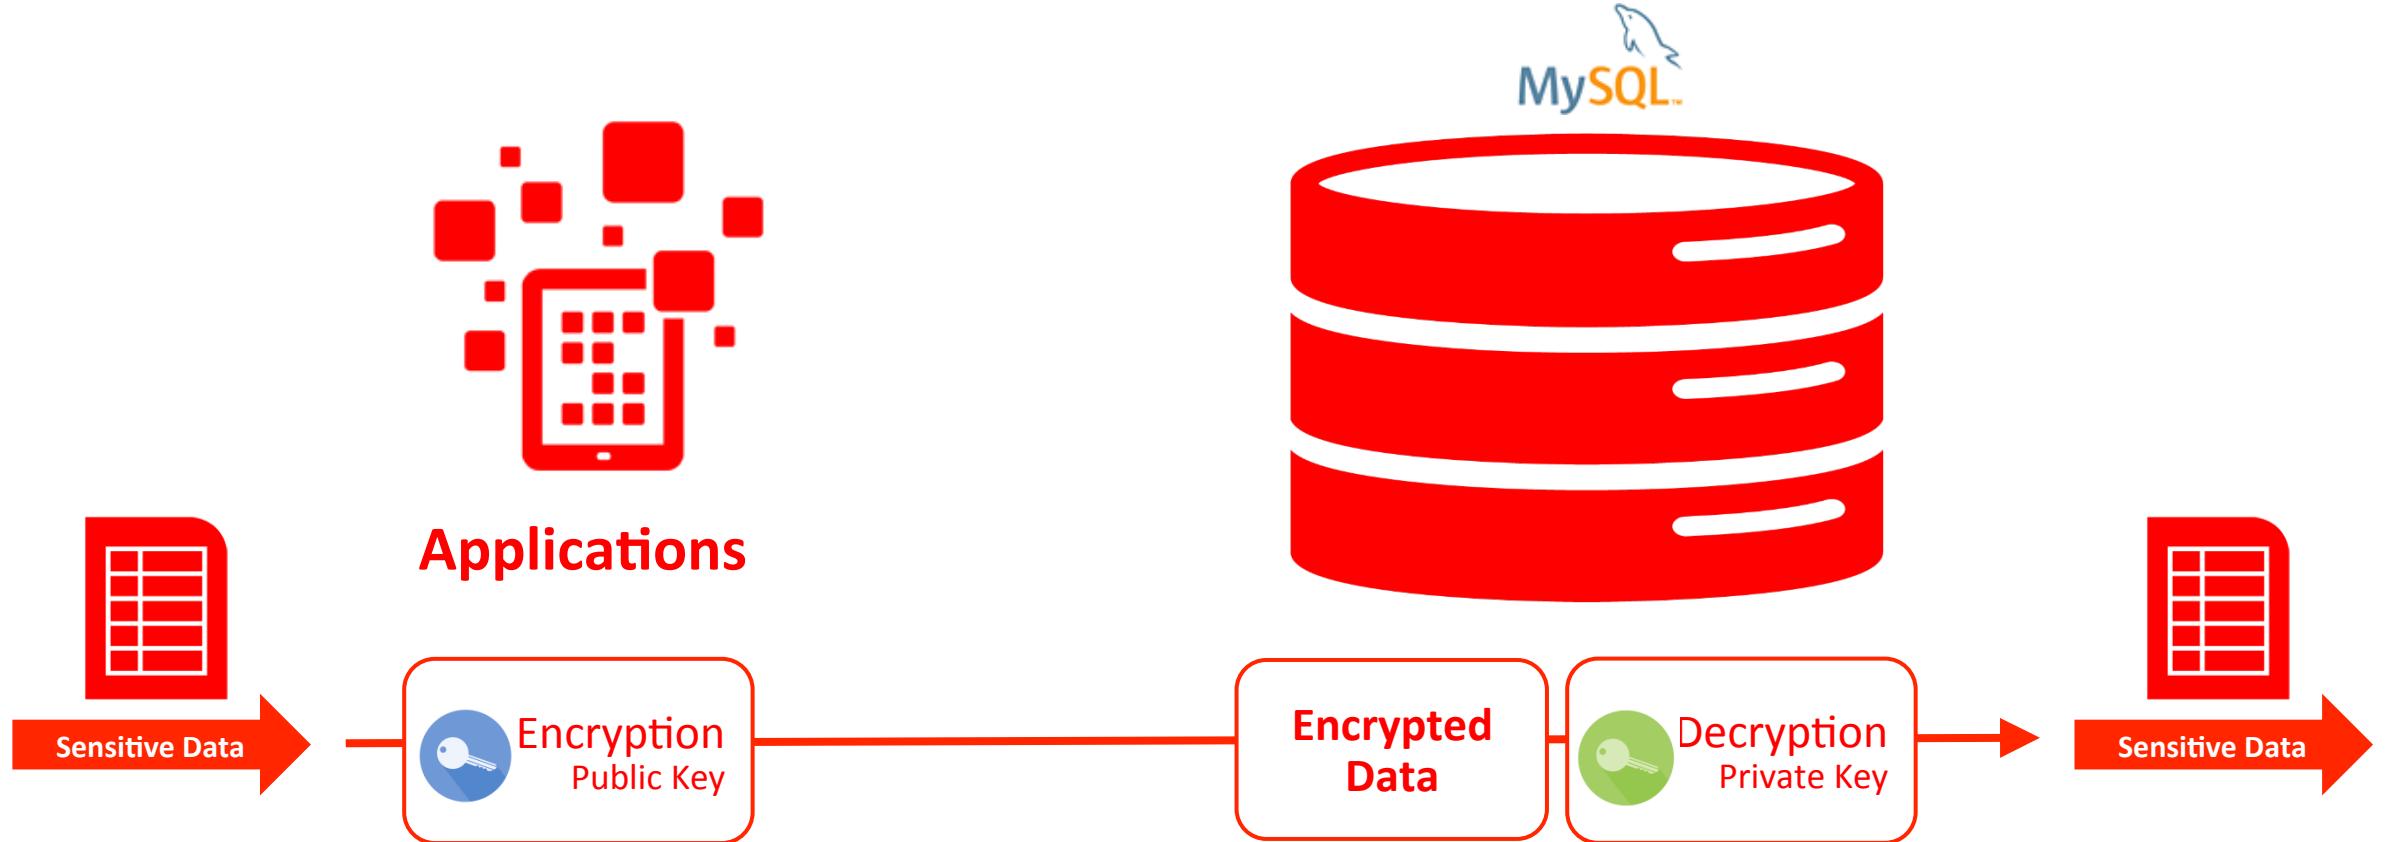

## Private / Public Key Pairs

- Generate using MySQL Enterprise Encryption Functions
- Use externally generated (e.g. OpenSSL)

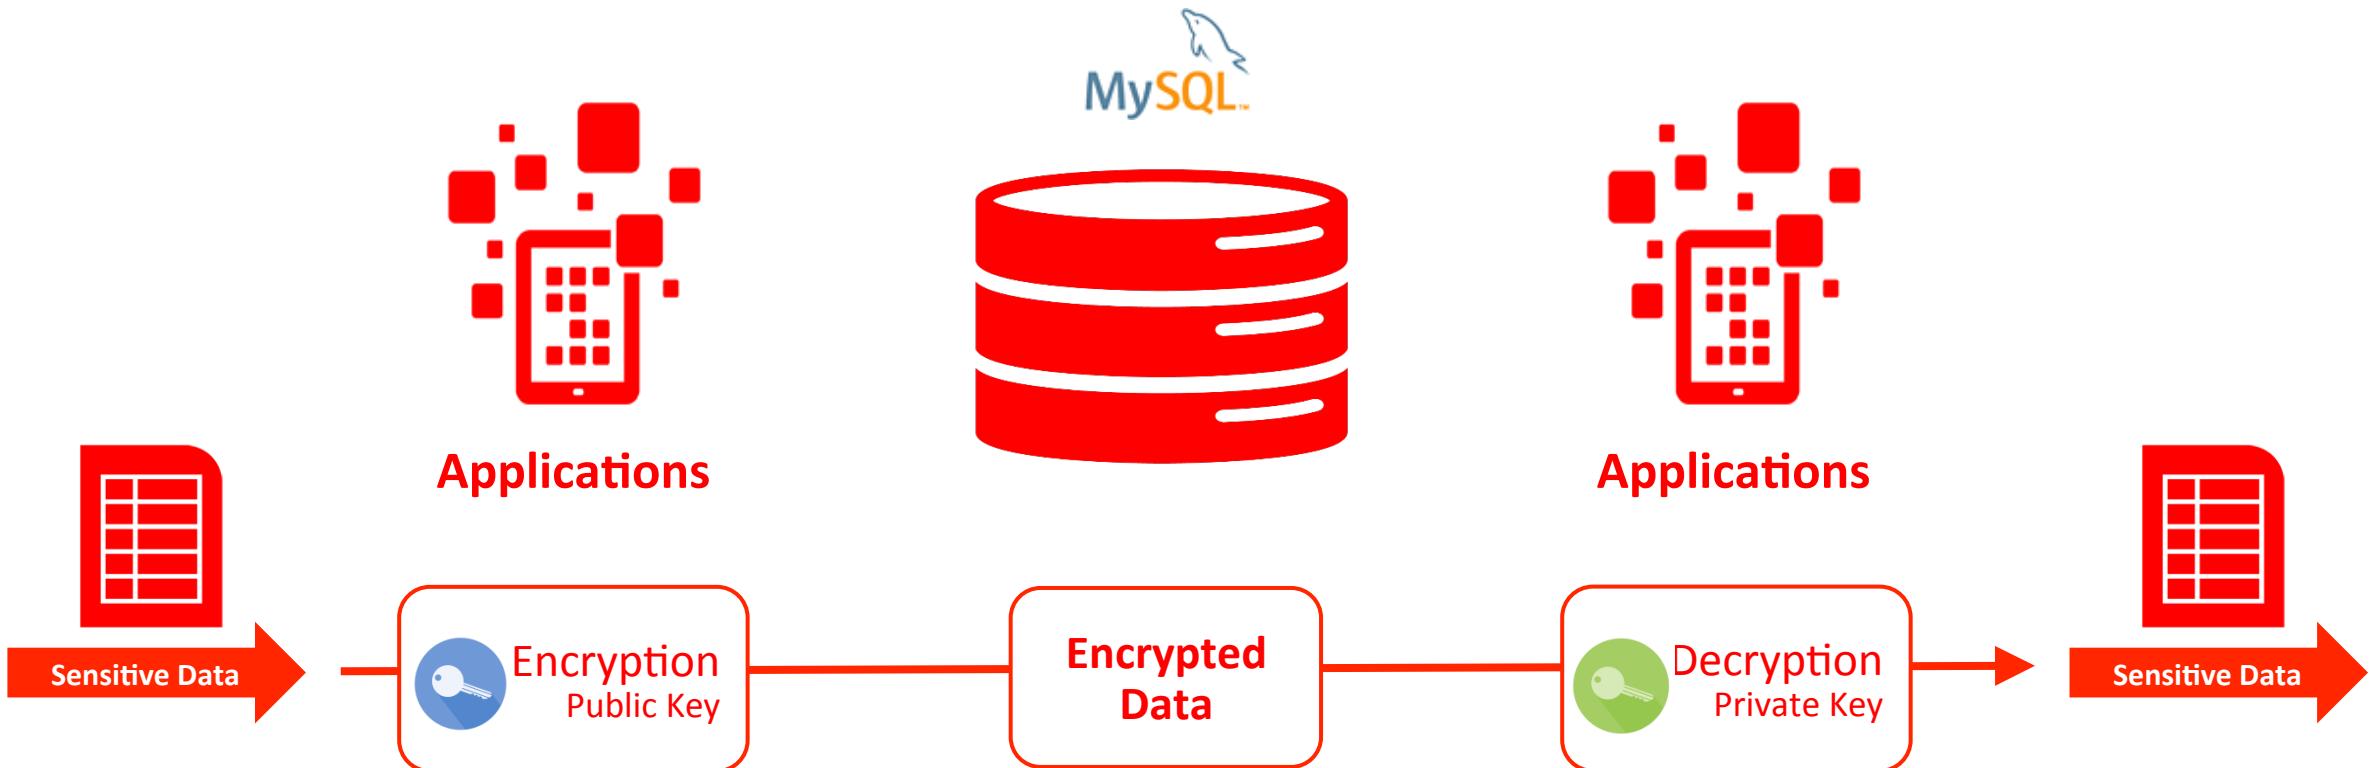

# MySQL Enterprise Encryption

App Encrypts/MySQL Decrypts

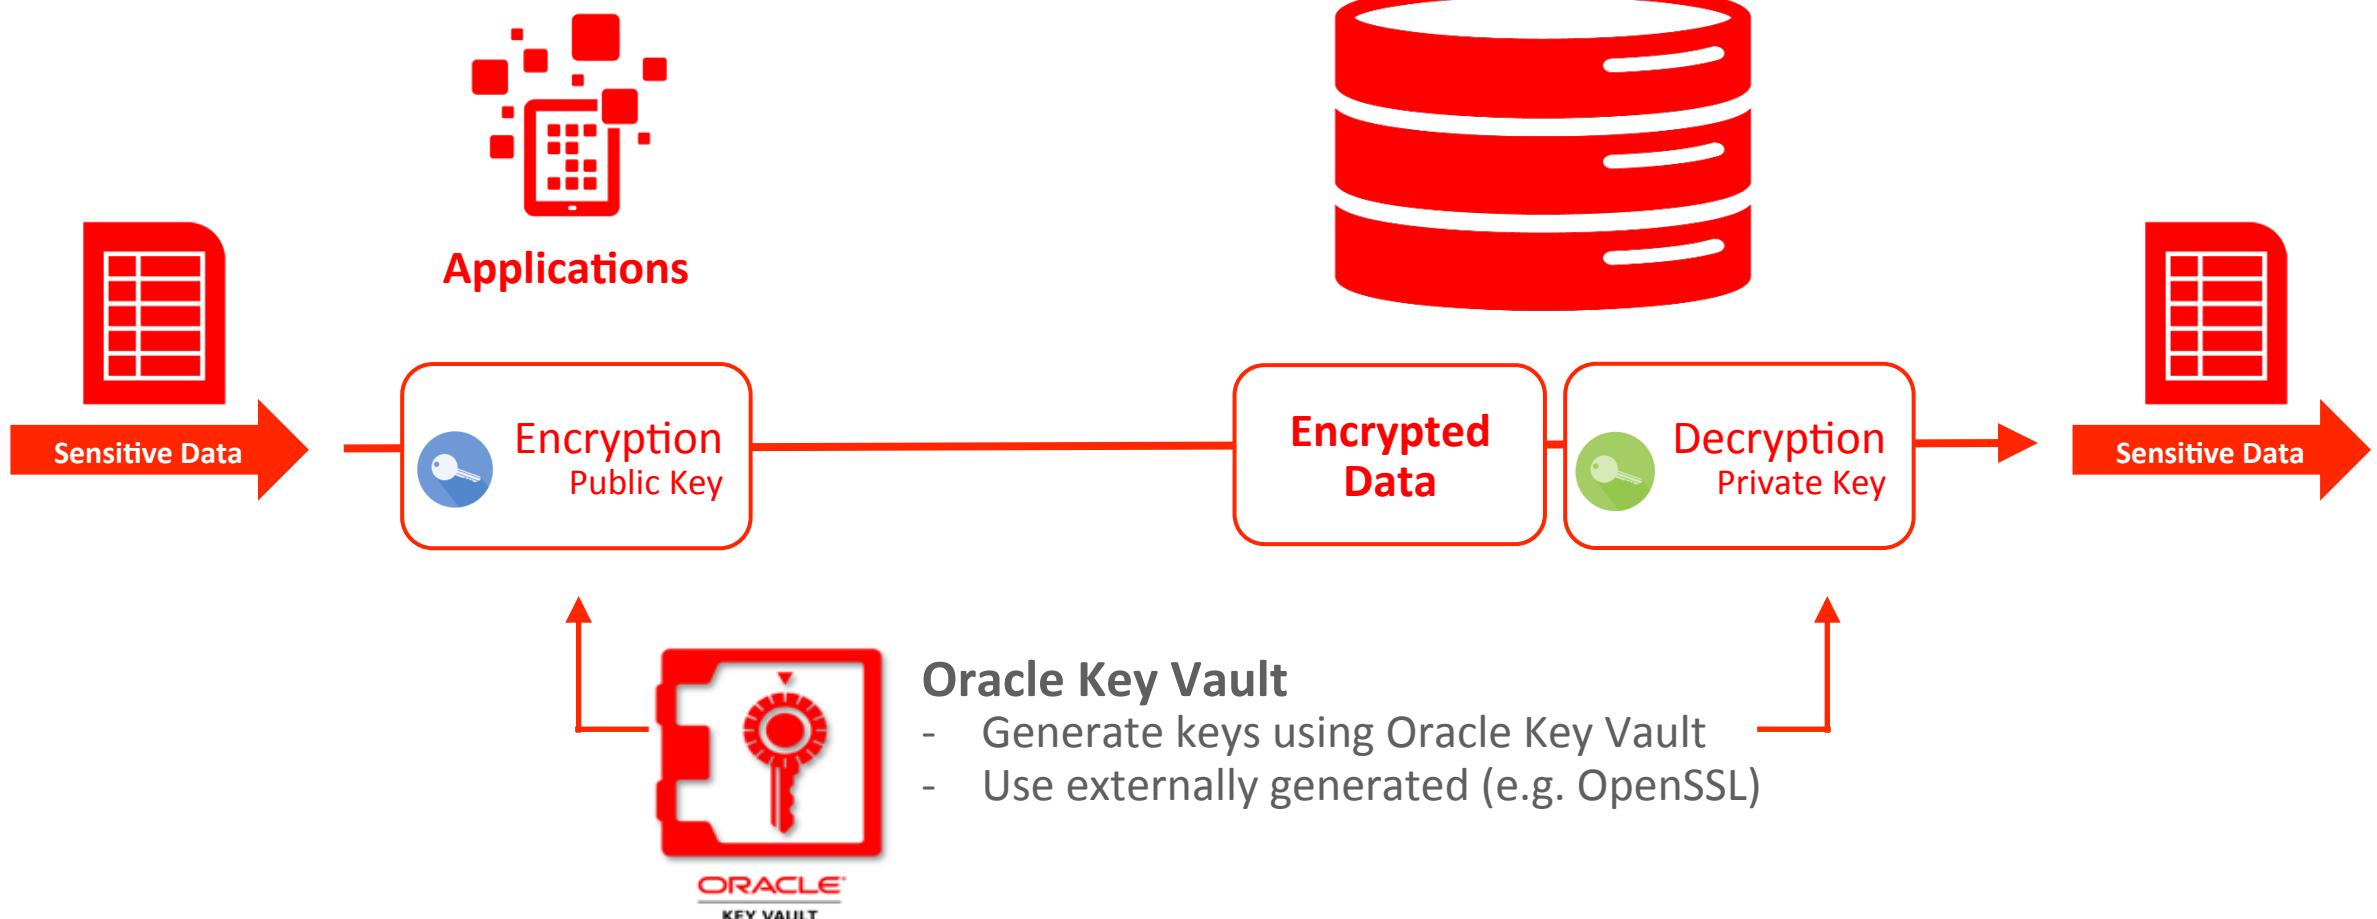

# MySQL Enterprise Encryption

App Encrypts / MySQL Stores / MySQL Decrypts

# MySQL Enterprise Encryption

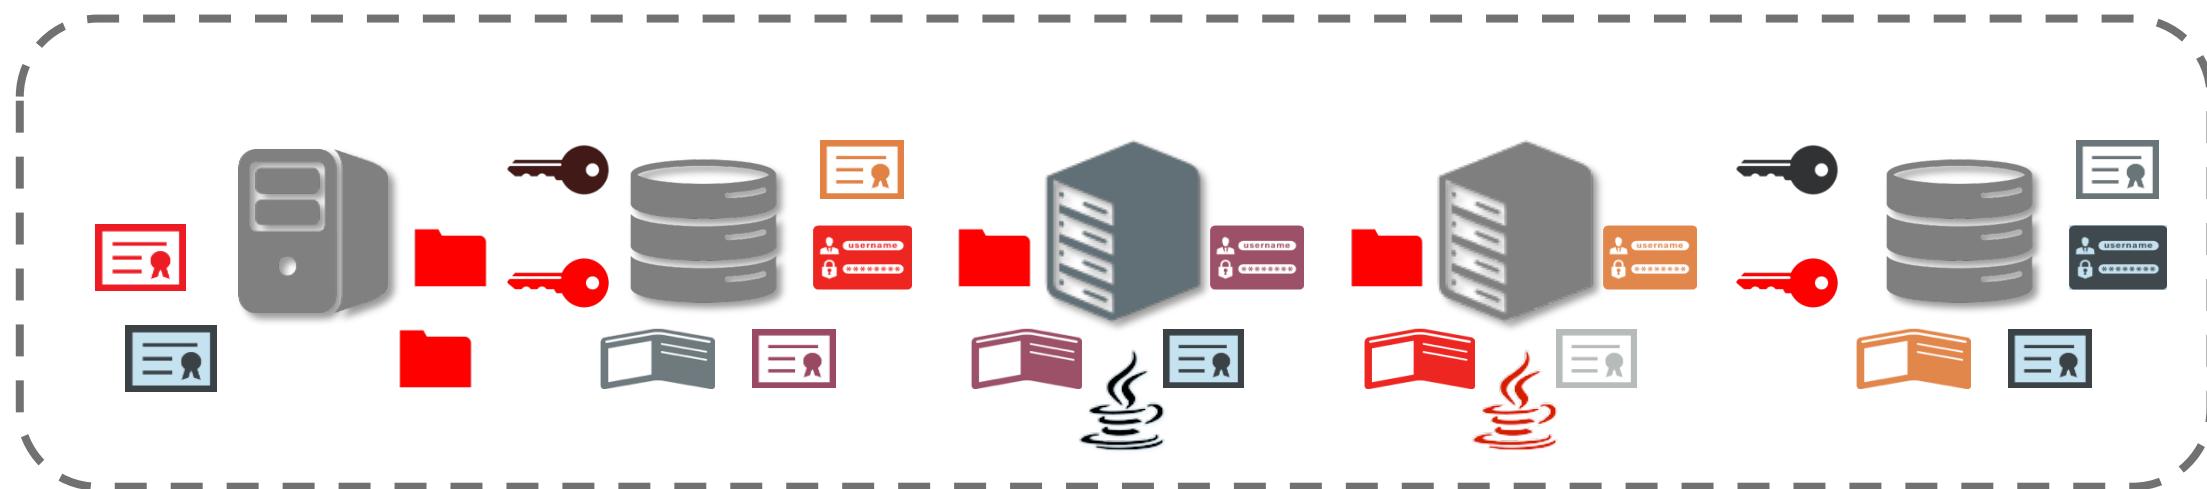

Oracle Key Vault Generates Keys (or externally generated)

## Safe Harbor Statement

The following is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described for Oracle's products remains at the sole discretion of Oracle.

# The Challenges of Key Management

## Management

- Proliferation of encryption wallets and keys
  - Authorized sharing of keys
  - Key availability, retention, and recovery
  - Custody of keys and key storage files

## Regulations

- Physical separation of keys from encrypted data
  - Periodic key rotations
  - Monitoring and auditing of keys
  - Long-term retention of keys and encrypted data

# Regulatory Drivers

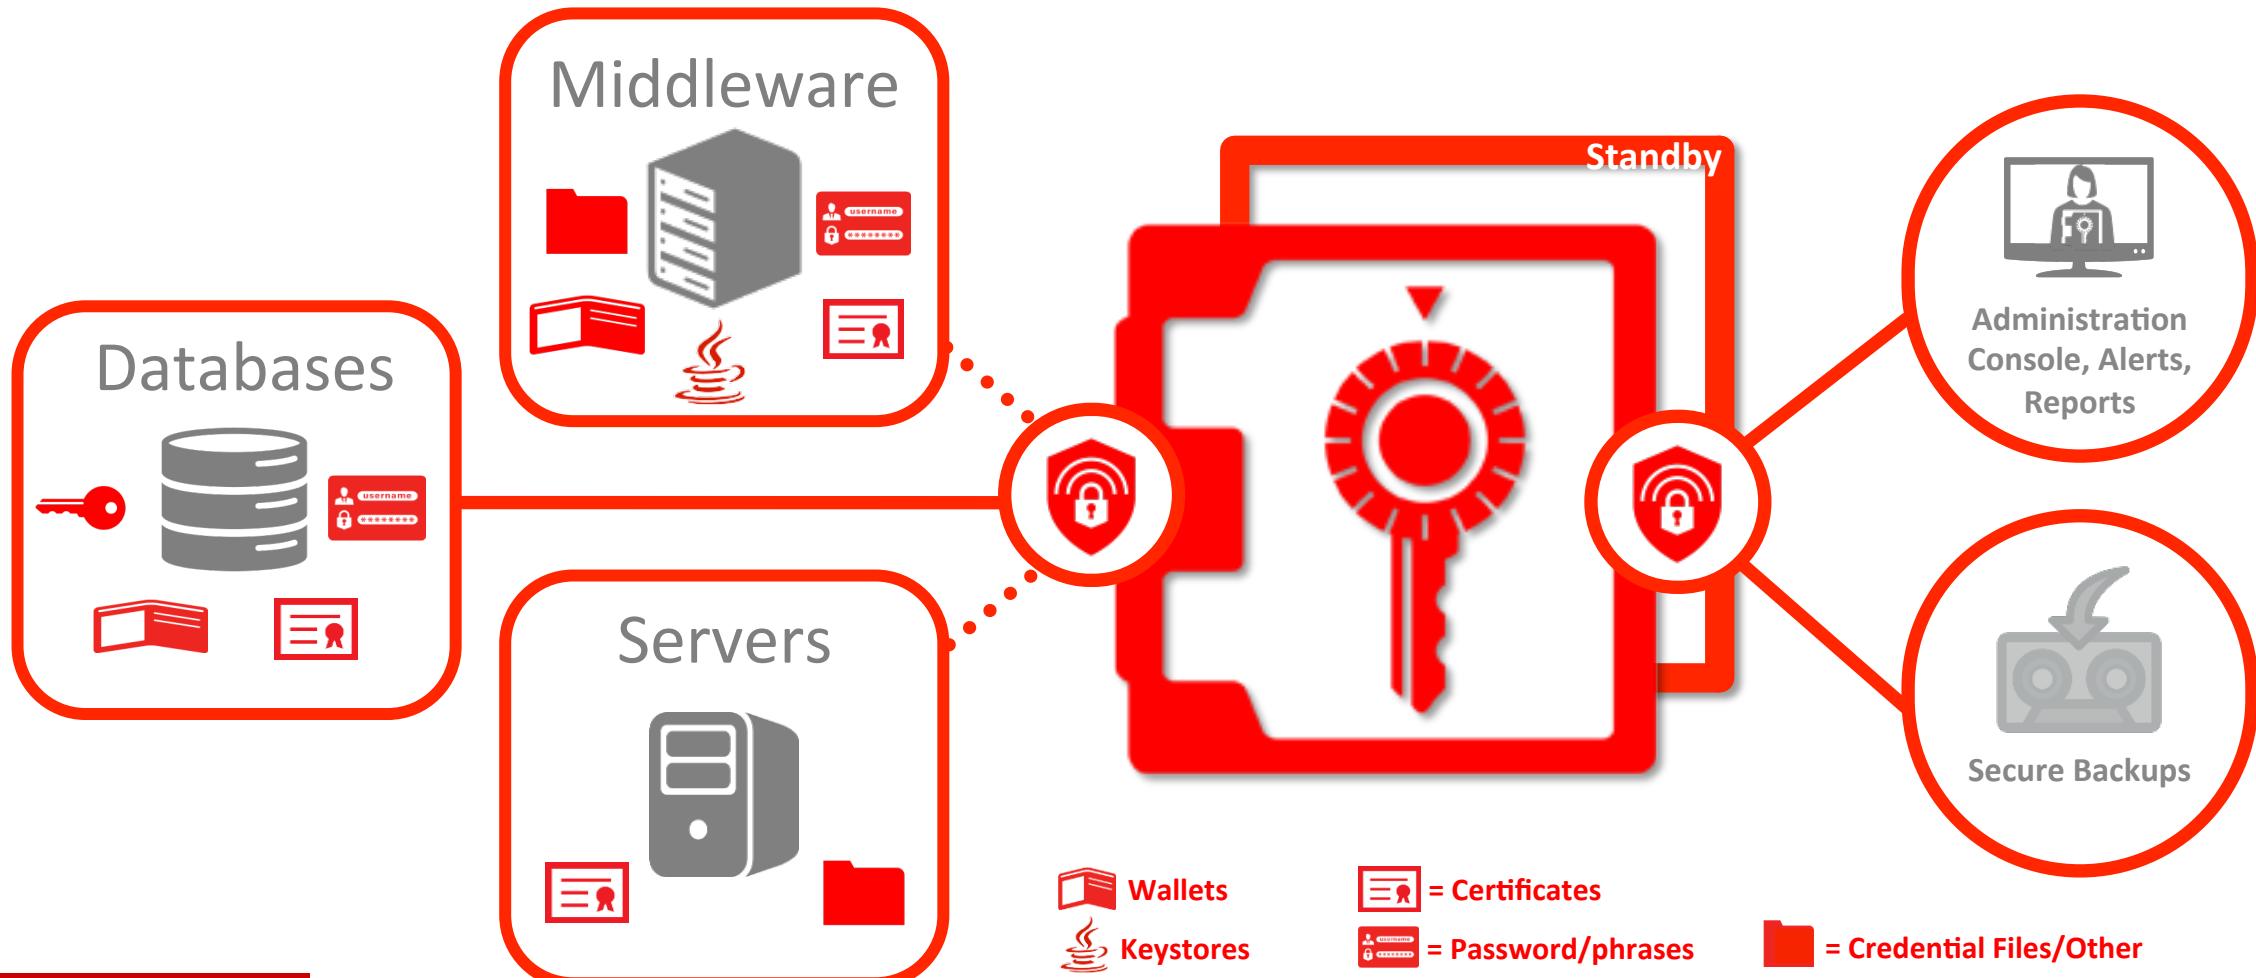

PCI DSS v3.0  
November 2013

- 3.5** Store cryptographic keys in a secure form (3.5.2), in the fewest possible locations (3.5.3) and with access restricted to the fewest possible custodians (3.5.1)
- 3.6** Verify that key-management procedures are implemented for periodic key changes (3.6.4)

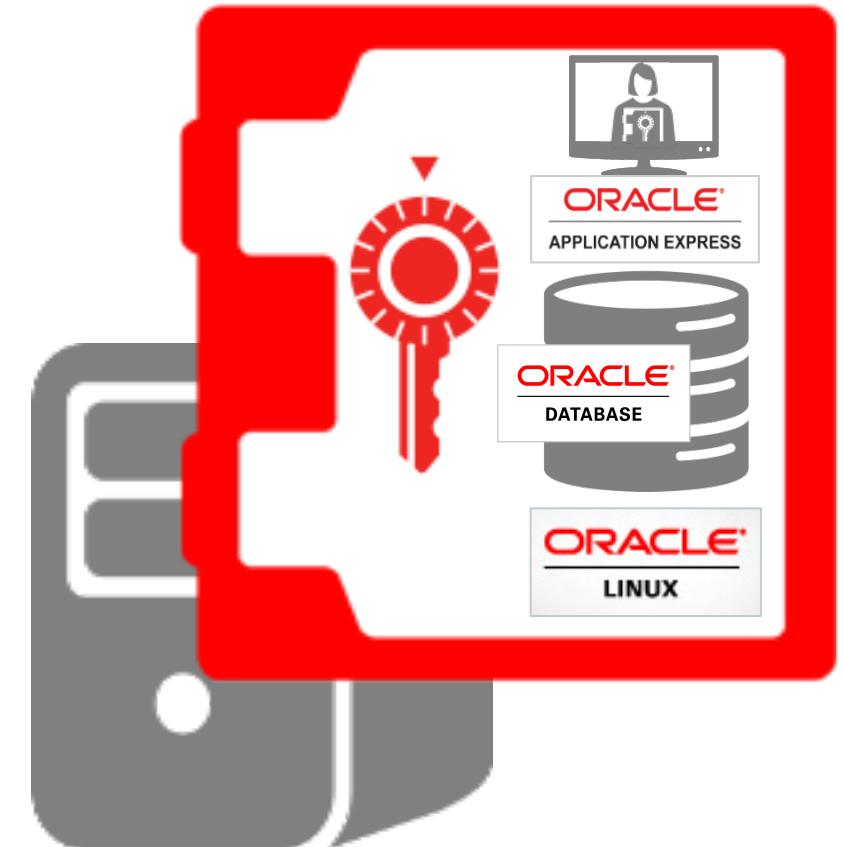

And more!

# Key Vault High-Level Architecture

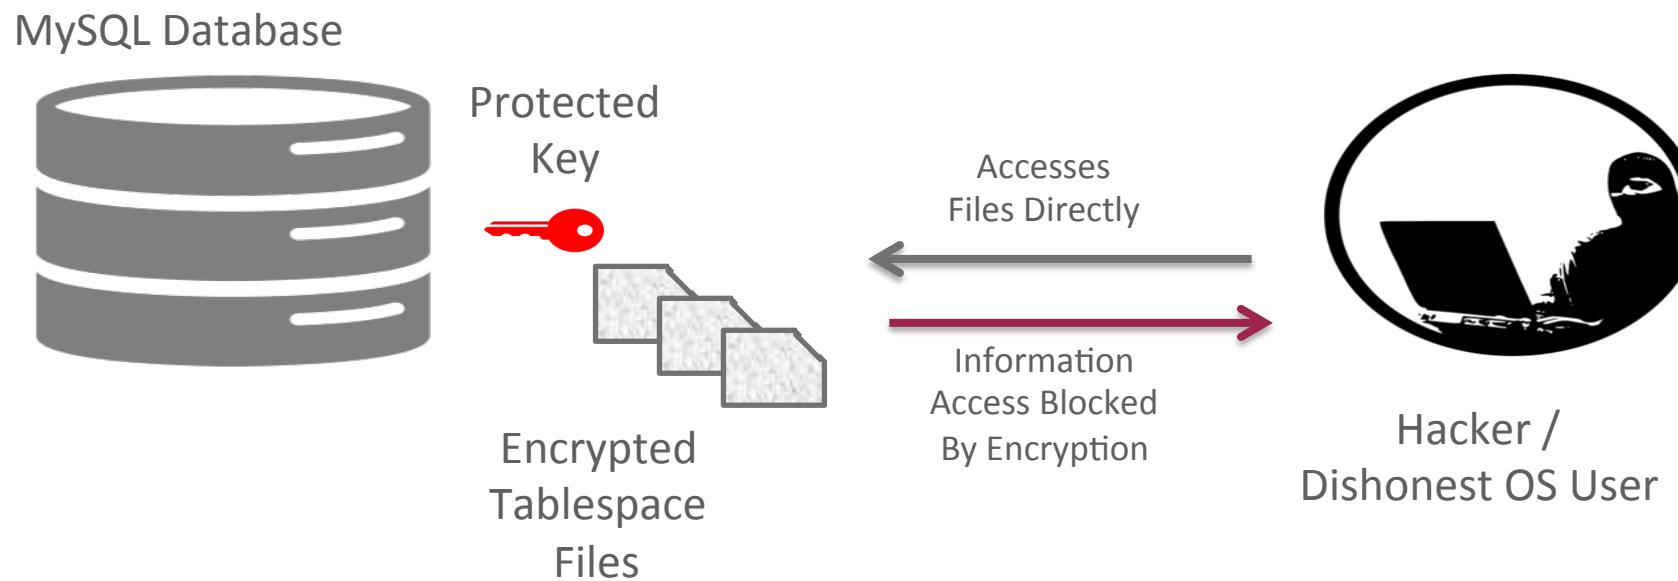

# Oracle Key Vault Software Appliance Platform

- Turnkey solution based on hardened stack
- Includes Oracle Database and security options
- Open x86-64 hardware to choose from
- Easy to install, configure, deploy, and patch
- Separation of duties for administrative users
- Full auditing, preconfigured reports, and alerts

# Attack on Files

# MySQL Transparent Data Encryption Goals

- Protect the Key – Most Important Thing
- Strong Encryption – AES 256
- Keep simple to manage – “complexity is the enemy of security”
  - One master key for whole instance
  - Easy , flexible to manage encrypted tablespaces (support Transportable Tablespace export/import)
- High Performance / Low Overhead
  - Simple Key Rotation without massive decrypt/encryption costs
- High Quality
  - Won't try to encrypt everything initially – but add more and more options over time
- Provide initial infrastructure to expand
  - Feedback to us from customers - Expand over time - Audit Data Encryption, Various Logs, Columns, Backups ...

# Introduction to Transparent Data Encryption in MySQL

## SQL

- New option in CREATE TABLE  
**ENCRYPTION="Y"**
- New SQL : **ALTER INSTANCE ROTATE INNODB MASTER KEY**

## Keyring plugin

- Used to retrieve keys

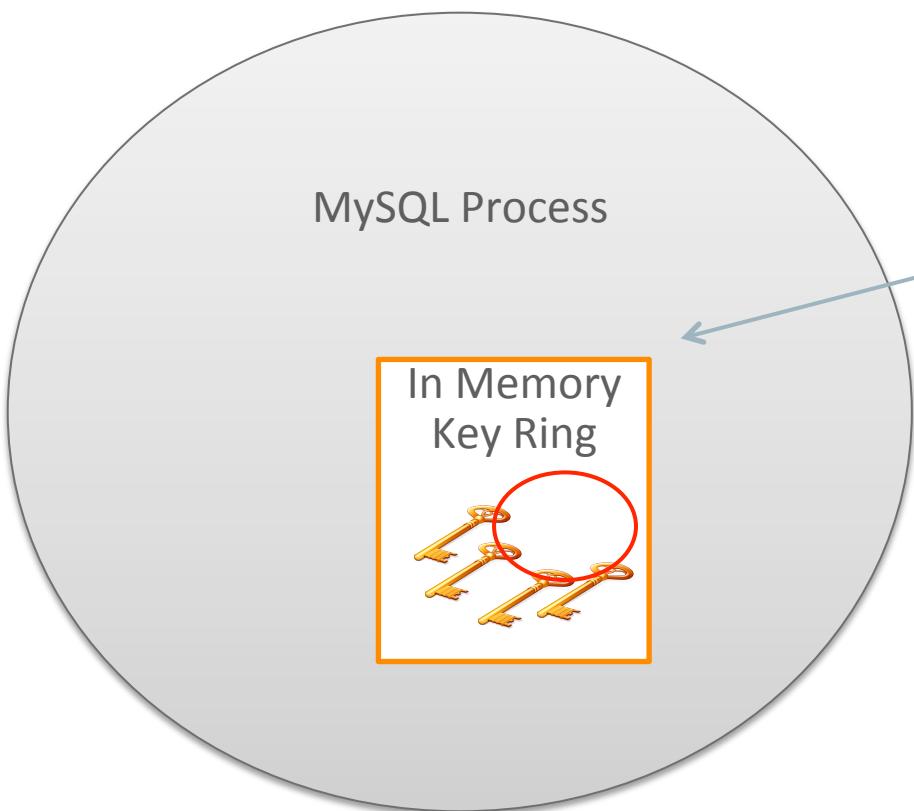

## Plugin Infrastructure

- New plugin type : **keyring**
- Ability to load plugin before InnoDB initialization : **--early-plugin-load**

## InnoDB

- Support for encrypted tables
- IMPORT/EXPORT of encrypted tables
- Support for master key rotation

# MySQL 5.7 Key Ring

Get/Put MySQL Keys  
On MySQL KeyRing

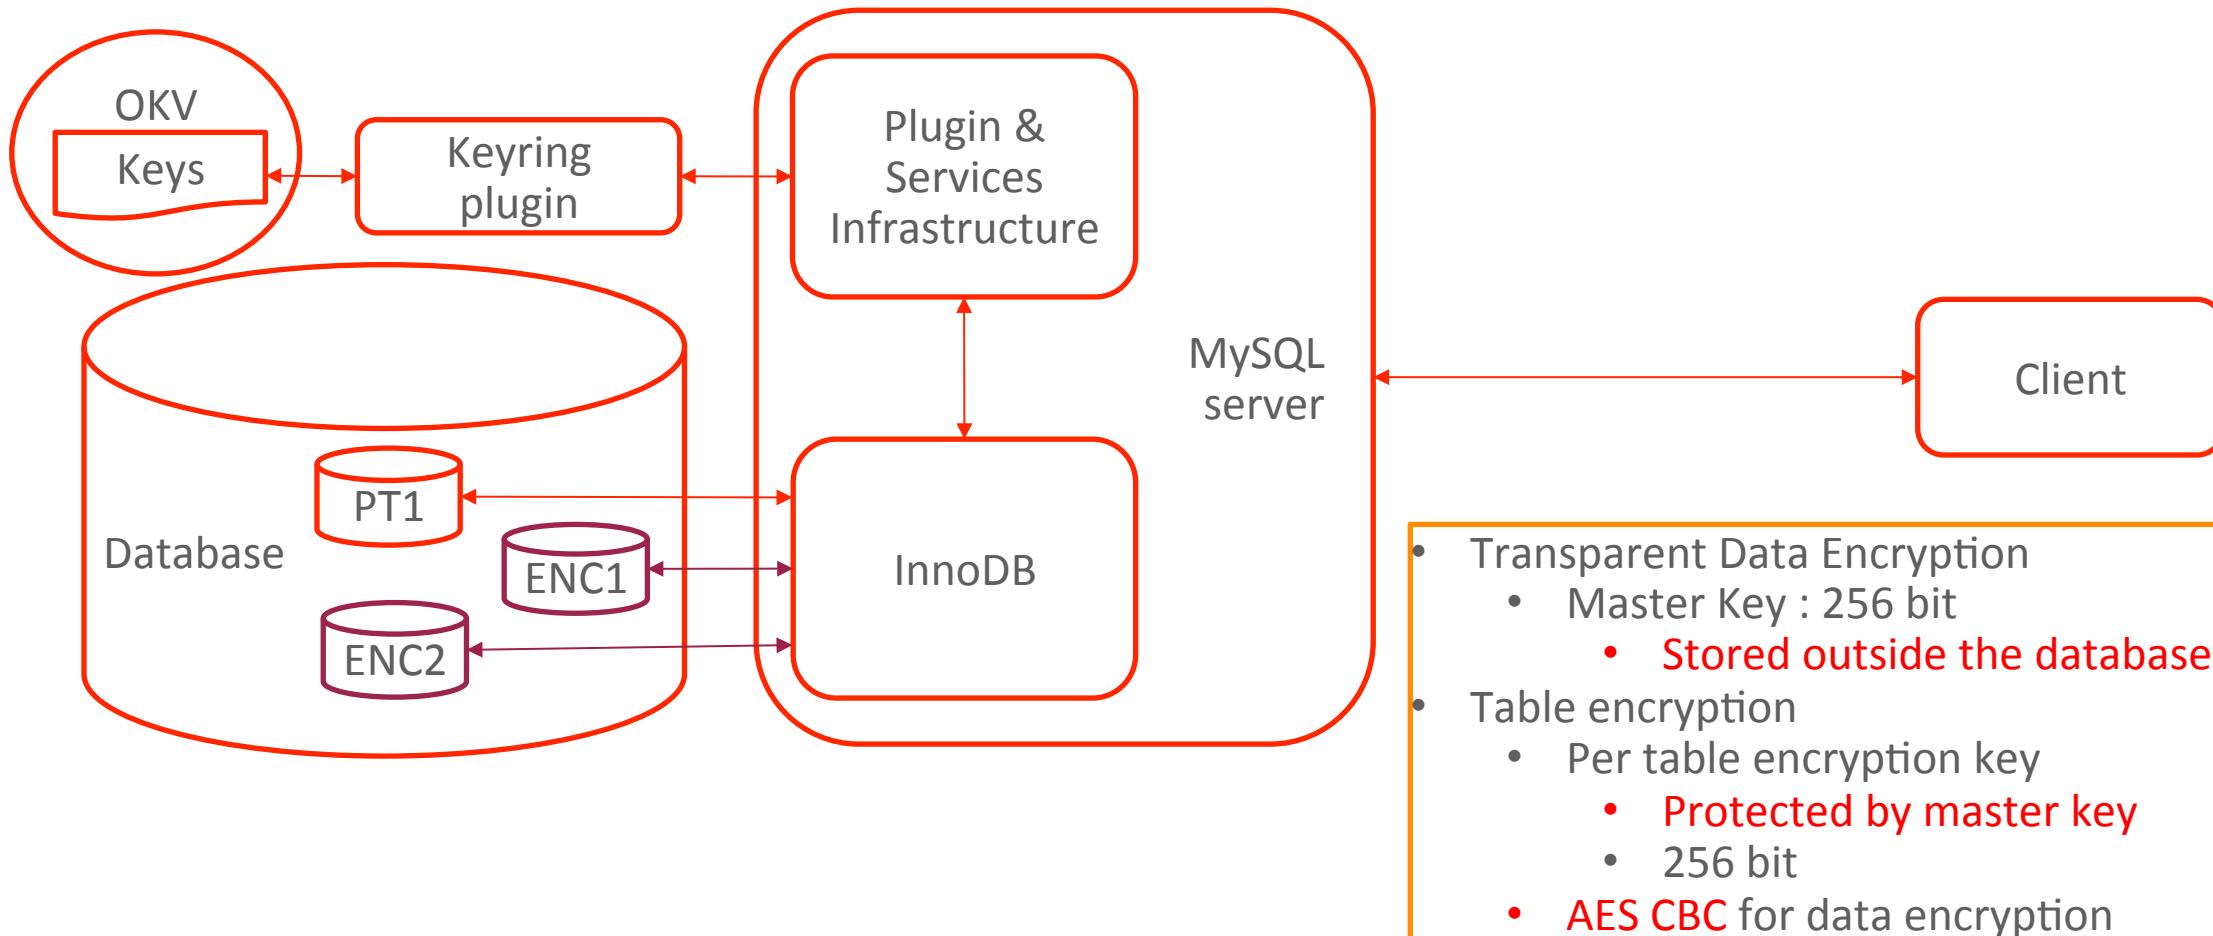

OKV or  
KMIP Compliance Key Vault

Keys on the keyring are only accessible to internal components  
Internal Code or Internal plugins

Key Rings are not persist – in memory and protected in memory

ACLs - who key is for – for example InnoDB Tablespaces

# More Detailed Architecture of Transparent Data Encryption in MySQL

# Database Auditing

Maintaining an audit trail is an essential security best practice

- “Trust but verify” approach to security
  - Ensure users with strong privileges don’t misuse those privileges
- Business Audit – Data Validity
  - Here’s proof my database data is accurate/correct
  - Prove no tampering to data has occurred
- Forensic analysis – as a component of any defense-in-depth strategy
  - Proactive - Am being / Was hacked
  - Reactive – How were we hacked, what was changed, taken, etc.

# MySQL Enterprise **Audit**

- Out-of-the-box logging of connections, logins, and query
- Simple to fine grained policies for filtering, and log rotation
- Dynamically enabled, disabled: no server restart
- XML-based audit stream
  - Send data to a remote server / audit data vault
    - Oracle Audit Vault
    - Splunk, etc.

Adds regulatory compliance to  
MySQL applications  
(HIPAA, Sarbanes-Oxley, PCI, etc.)

# Why you need to audit

- Sensitive data
  - Create Audit rules on your most sensitive data, powerful users, exposed applications
- Comply with regulatory standards
  - PCI, HIPAA, FERPA and SOX requirements
- Minimal Overhead
  - Collects critical audit data without minimal performance impact

# MySQL Enterprise Audit - Work Flow

# Complete Audit Data

## Complete event details

- Who
- What
- When
- How
- Status
- From Where
- DB version
- OS version
- Options
- And more

```
<?xml version="1.0" encoding="UTF-8"?>
<AUDIT>
  <AUDIT_RECORD
    TIMESTAMP="2012-08-02T14:52:12"
    NAME="Audit"
    SERVER_ID="1"
    VERSION="1"
    STARTUP_OPTIONS="--port=3306"
    OS_VERSION="i686-Linux"
    MYSQL_VERSION="5.5.28-debug-log"/>
  <AUDIT_RECORD
    TIMESTAMP="2012-08-02T14:52:41"
    NAME="Connect"
    CONNECTION_ID="1"
    STATUS="0"
    USER="joe"
    PRIV_USER="root"
    OS_LOGIN=""
    PROXY_USER=""
    HOST="SERVER1"
    IP="127.0.0.1"
    DB="joes_db"/>
  <AUDIT_RECORD
    TIMESTAMP="2012-08-02T14:53:45"
    NAME="Query"
    CONNECTION_ID="1"
    STATUS="0"
    SQLTEXT="SELECT * FROM joes_table;"/>
</AUDIT>
```

# New Audit Filtering

- Starting with MySQL Enterprise 5.7.13
- Allows DBAs to “custom” design audit process
  - Use very fine grained rules
    - Reduce audit log file size
    - Reduce File System IO and Storage / Increases performance (less items logged).
    - Increases audit log post processing efficiency – less data to process for immediate answers.
    - Defined using JSON
  - Coarse grained rules
    - When you need to watch everything
    - Obsolete. Recommended is to use new audit log filtering.

# New Auditing Solution Uses

- Expanded “Event” model
  - Allows for very fine grained auditing
- Simple but powerful
  - Uses JSON to define filters

Event class	Event subclass
GENERAL	STATUS
CONNECTION	CONNECT
	CHANGE_USER
	DISCONNECT
TABLE_ACCESS	READ
	INSERT
	UPDATE
	DELETE

# Connection Event Fields

Name	Type	Description	Name	Type	Description
<b>status</b>	INT	Status of the event: 0: OK, otherwise error state.	<b>host.str</b>	STRING	Host string.
<b>user.str</b>	STRING	Connecting user string.	<b>ip.str</b>	STRING	IP string.
<b>priv_user.str</b>	STRING	Account user string.	<b>database.str</b>	STRING	Initial database name.
<b>external_user.str</b>	STRING	External plugin authenticated user.	<b>connection_type</b>	INT	Connection type value: 0: Undefined; 1: TCP/IP; 2: Socket; 3: Named pipe; 4: SSL; 5: Shared memory
<b>proxy_user.str</b>	STRING	Proxy user string.			

... and other fields.

# Table Event Fields

Name	Type	Description
event_subclass	INT	Table access type (read, insert, update or delete).
connection_id	STRING	Unique connection id.
sql_command_id	UINT	SQL statement type (SELECT, INSERT ... SELECT, LOAD XML INFILE etc.).
query	STRING	Query string accessing the table.
table_database	STRING	Database (schema) name.
table_name	STRING	Table name.

# Filters can be SIMPLE

Log all connection events:

- successfull and failed connection attempts;
- disconnects;
- user change during session (change\_user command).

```
{ "filter": {  
    "class": {  
        "name": "connection" } } }
```

# Filters can be Specific - Log Failed SSL Connects

Log failed SSL connection attempts:

```
{ "filter": {  
    "class": {  
        "name": "connection",  
        "event": {  
            "name": "connect",  
            "log": {  
                "and": [  
                    { "not": { "field": { "name": "status",  
                                         "value": 0 } } },  
                    { "field": { "name": "connection_type",  
                               "value": "::ssl" } } ] } } } }
```

# Rules can be Specific related to Tables

All deletions, insertions, updates on bank\_database.accounts

```
{ "filter":{  
  "class": {  
    "name": "table_access",  
    "event": {  
      "name": [ "delete", "insert", "update" ],  
      "log": {  
        "and": [ { "field": { "name": "table_database.str",  
                               "value": "bank_database" } },  
                { "field": { "name": "table_name.str",  
                               "value": "accounts" } } ] } } } }
```

# A Lot of Filtering Possibilities- String Functions

```
{ "filter": {  
    "class": {  
        "name": "general",  
        "event": {  
            "name": "status",  
            "log": {  
                "and": [  
                    { "field": {  
                        "name": "general_command.str",  
                        "value": "Query" } },  
                    { "function": {  
                        "name": "string_find",  
                        "args": [ "create_db,create_user",  
                                { "field": "general_sql_command.str" }  
                            ] } ] } } } }
```

# New Auditing Solution Uses

- Expanded “Event” model
  - Allows for very fine grained auditing
- Simple but powerful
  - Uses JSON to define filters

# Basic Audit Log Events

Event class	Event subclass
GENERAL	STATUS
CONNECTION	CONNECT
	CHANGE_USER
	DISCONNECT
TABLE_ACCESS	READ
	INSERT
	UPDATE
	DELETE

NEW

New audit log filtering can  
filter against event fields  
values!

# Connection Event Fields

Name	Type	Description	Name	Type	Description
<b>status</b>	INT	Status of the event: 0: OK, otherwise error state.	<b>host.str</b>	STRING	Host string.
<b>user.str</b>	STRING	Connecting user string.	<b>ip.str</b>	STRING	IP string.
<b>priv_user.str</b>	STRING	Account user string.	<b>database.str</b>	STRING	Initial database name.
<b>external_user.str</b>	STRING	External plugin authenticated user.	<b>connection_type</b>	INT	Connection type value: 0: Undefined; 1: TCP/IP; 2: Socket; 3: Named pipe; 4: SSL; 5: Shared memory
<b>proxy_user.str</b>	STRING	Proxy user string.			

... and other fields.

# Table Event Fields

Name	Type	Description
event_subclass	INT	Table access type (read, insert, update or delete).
connection_id	STRING	Unique connection id.
sql_command_id	UINT	SQL statement type (SELECT, INSERT ... SELECT, LOAD XML INFILE etc.).
query	STRING	Query string accessing the table.
table_database	STRING	Database (schema) name.
table_name	STRING	Table name.

# Filters can be SIMPLE

Log all connection events:

- successfull and failed connection attempts;
- disconnects;
- user change during session (change\_user command).

```
{ "filter": {  
    "class": {  
        "name": "connection" } } }
```

# Filters can be Specific - Log Failed SSL Connects

Log failed SSL connection attempts:

```
{ "filter": {  
    "class": {  
        "name": "connection",  
        "event": {  
            "name": "connect",  
            "log": {  
                "and": [  
                    { "not": { "field": { "name": "status",  
                                         "value": 0 } } },  
                    { "field": { "name": "connection_type",  
                               "value": "::ssl" } } ] } } } }
```

# Rules can be Specific related to Tables

All deletions, insertions, updates on bank\_database.accounts

```
{ "filter":{  
  "class": {  
    "name": "table_access",  
    "event": {  
      "name": [ "delete", "insert", "update" ],  
      "log": {  
        "and": [ { "field": { "name": "table_database.str",  
          "value": "bank_database" } },  
        { "field": { "name": "table_name.str",  
          "value": "accounts" } } ] } } } }
```

# A Lot of Filtering Possibilities- String Functions

```
{ "filter": {  
    "class": {  
        "name": "general",  
        "event": {  
            "name": "status",  
            "log": {  
                "and": [  
                    { "field": {  
                        "name": "general_command.str",  
                        "value": "Query" } },  
                    { "function": {  
                        "name": "string_find",  
                        "args": [ "create_db,create_user",  
                                { "field": "general_sql_command.str" }  
                            ] } ] } } } }
```

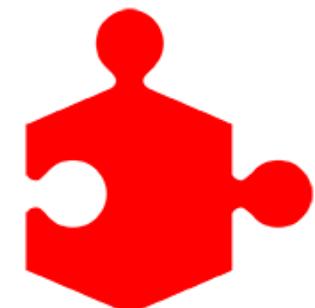

# MySQL Enterprise **Backup**

- Online Backup for InnoDB (scriptable interface)
- Full, Incremental, Partial Backups (with compression)
- Strong Encryption (AES 256)
- Point in Time, Full, Partial Recovery options
- Metadata on status, progress, history
- Scales – High Performance/Unlimited Database Size
- Windows, Linux, Unix
- Certified with Oracle Secure Backup, NetBackup, Tivoli, others

# MySQL Enterprise **Oracle Certifications**

- Oracle Enterprise Manager for MySQL
- Oracle Linux (w/DRBD stack)
- Oracle VM
- Oracle Solaris
- Oracle Solaris Clustering
- Oracle Clusterware
- Oracle Audit Vault and Database Firewall
- Oracle Secure Backup
- Oracle Fusion Middleware
- Oracle GoldenGate
- My Oracle Support

**MySQL integrates into your Oracle environment**

# Oracle Audit Vault and Database Firewall

- Oracle DB Firewall
  - Oracle, MySQL, SQL Server, IBM DB2, Sybase
  - Activity Monitoring & Logging
  - White List, Black List, Exception List
- Audit Vault
  - Built-in Compliance Reports
  - External storage for audit archive

**ORACLE®**
